Check out Doppler Systems, P. O. Box 2780, Carefree, AZ 85377,
(602) 488-9755, (602) 488-1295 fax. They make some of the best
doppler units available.

Also, check out the book Transmitter Hunting, Radio Direction Finding
Simplified by Joseph Moell K0OV and Thomas Curlee, WB6UZZ.
Inside you'll find complete construction plans for the Roanoke
Doppler. I think a pc board and complete kit is available for this unit.
The book is published by TAB Books.

Have fun and 73,
Richard

> Thank You!
> zrjim@aol.com

It requires routing a 455khz output out the back of the scanner so it
can be hooked to the antenna output of a shortwave receiver tuned to
this frequency. A very detailed explanation of how to do this is in
Bill Cheek's Scanner Modification Book (The first one). It's Mod
14, on page 117 in my copy. I've done this Mod to my Pro-2006 and love
it! It works fantastic. I've hooked it to my Kenwood R-5000 and also
a Realistic DX-440 and worked great on both. It's a fairly easy mod
to do, Good Luck.

Ricky

Hi, Steve / Carlos --

That's basically the right thing to do, but note that if you take the signal directly from the discriminator output (R97-R99), it will be accompanied by a strong amplitude-modulated component at the 455 kHz 3rd IF frequency. If you were to feed the signal directly into a saturating amplifier based on any IC op amp with a higher gain-bandwidth product than the ancient 741, some false triggering would probably occur as a result. This would not be a problem with your recommended "best" pickup point (C131-C84-R99) because R99 and C131 form a low-pass filter that gets rid of the unwanted 455 kHz artifact.

I recently "upgraded" my own R7000 to include a discriminator output at its spare jack (mighty nice of 'em to include that jack :-), but I took a slightly-unconventional approach. I inserted a copy of the low-pass filter (R99/C131 combination) in parallel with the existing filter. (It was easier to rig up the parallel filter than it would've been to remove the board.) I fed the usual 741 amplifier from the "new" resistor-capacitor junction through a 0.1 uF blocking capacitor.

I wanted a nice, clean +/- 12V RS-232-compatible square wave at the "spare" jack, so that meant mounting not only the 741 inside the R-7000's case, but also a +/- 12V power supply, which is not available at all from the "stock" R7000. I used a heavily-filtered NE555-based oscillator/multiplier for -12, and a 7812 off the main filter cap for +12. The power supply board mounted easily to a couple of unused standoffs on the bracket that holds the R7000's own internal switching-supply module.

Needless to say, this was a lot of work, but it's kind of nice having a clean, plug-and-play bipolar digital output on the receiver. I loaned my receiver to a friend with the MDT program, and it worked fine (meaning, about as well as a lame clock-recovery algorithm like MDT's could ever work), even on signals that were half-buried in the noise floor.

Yes thats right, a BC890XLT with alpha display AND 500 MEMORY CHANNELS!!! You say it isn't so? Well your probably right becouse you probably know as well as I do the actual specs on this model. However if you have a copy of the Winter 1996/97 Hobby Radio Stop brocure, they show a b/w picture of a 890XLT with alpha display & 500 channels. Remarkably looks like the same as the b/w picture of the 9000XLT..... Kinda found this funny, thought maybe a few others out there in scannerland would get a good laugh out of this too.

>cop asking for your ID....to do otherwise would be stupid.

Stupid is not the question here. Does the cop have the right to question me
in my vehicle without substantial reason?

You might
>protest, but when it comes down to it, he has a gun and a badge. If he
>claims he thought you were someone else, you may wind up in the can
>for not disproving it.

Just exactly how legal is THAT???? I think I'd have some blood sucking lawyer
on his ass so fast it would make his head swim!!! (I hate lawyers, don't get
me wrong) How many ideals of the constitution are violated if the above were
to occur????? How many???

>>
>>I wasn't going to give him the conversation I had taped 20 min before he got
>>there about some criminal that was in the area just to have my scanner taken
>>from me.
>A wise choice--it sounds like he had a hair up his ass to begin with.

It still bugs me. I would applaud him for checking me out. I did look very
suspicous in my car with 3 antennas on the roof and enough wires running
around the car to wire a substation. BUT, I was kind of ticked that he was
bugging me about the scanner and ham radio. (he wanted to know what that one
was too and who I talked to on it) It was like I had to defend the legality
of a couple of radios in my car!!! They're just radios!!! It's just a
hobby!!! It's not like I'm selling the Lincoln bedroom or something. *grin*

>>That's what the new scanner laws have done.
>What "new scanner laws" are you referring to?

It's not really that new I guess. '86 cellular law.

>Well, once again someone blames a political party for their woes. Laws
>can't be passed without support---

(it sure as hell helps if you have the financial backing for them though)
cough...cough...cellular one...cough..

Let me ask you this...

Which do you think is more of a threat to your freedoms in the USA?

ME in my car listening to the scanner, or the MARTINS in FL taping NEWT and
giving it to their congressman. Why haven't they been charged? What gives?

Wrongo, buckaroo. Study a little Constitutional Law before making up theories of your own. The police must have a certain level of reasonable suspicion before taking you into custody. Being rude does not legally establish enough suspicion to give them authority to detain a citizen. The U.S. Supreme Court's interpretations of the 4th Amendment over the past couple of decades have limited the cops' authority when dealing with people who are not criminal suspects.

I alos saw that. I can't believe they are selling it at 47% off! Around the 1st of Feb, I bought a PRO-51 for $199, and I thought that was a good deal... Guess not :). That's the reason I buy from Radio Shack. If their stuff isn't on sale, its overpriced. But because of that, not many people buy them. Therefore, they put them on sale for EXTREMELY good prices, they go bye-bye, and the cycle repeats itself. Only downside to the PRO-60 is that it isn't as sensitive, but that is minor.

Also, with the amount of cellular "cloning" that goes on in PA (I once read that the king of Prussia area is filled with people with cloning hardware) he was probably a little suspicious of someone sitting in a parked car with antennas on it.

3693. Need Advice on Buying Scanner for Railroad Frequencies

From the FAQ "Buying a Used Scanner:"

PRO-60: 1995 vintage. Very good portable made by GRE. 200
channels, single search range. Similar features and same
IFs as the PRO-43 it replaced but the PRO-60 has wider
frequency coverage and crisper audio. Covers 75 MHz and
commercial FM broadcast bands. Improved Direct search can
be stepped manually in single steps. Uses same 6 cell
battery tray as other high end GRE portables. Railfans take
note -- the PRO-60 and PRO-43 are subject to interference in
160 - 162 MHz range. Draws 100 mA while scanning. See "The
Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in
Monitoring Times, September 1995.

3698. Getting an AR2500 to work with a Scout

Newsgroup: rec.radio.scanner
Date: 1997-02-28 00:00:00 UTC
From: RobertRobinson <psykik@gramercy.ios.com>
Message-ID: <33166B81.613C@gramercy.ios.com>
Source record: 205688

Greetings,
I have a nifty lil' AOR AR2500 which was a "pre-ban" full coverage wide band receiver. What would make my life complete would be to interface it with an Optoelectronics Scout, much like the newer generation scanners will.

I spoke to an Optoelectronics tech at Dayton Hamvention who noted thatthe 2500 uses a different language/protocol through the RS-232 port which is not suppored by the Scout. Obviously, AOR and/or Optoelectronics did not want to designsoftware or hardware to serve as an interface. I wonder if any after market provider or private individual sat down to write the interface code or build such an interface which will allow the two units to communicate.

Message-ID: <19970228055001.AAA27825@ladder02.news.aol.com>
Source record: 205689

Lorin,

The least expensive new scanner currently on the market with military UHF coverage is a new Radio Shack unit, the Pro-2045, with a retail price of $349.95.
However, Communications Electronics currently has the Uniden 3000XLT on sale for $329.95 and the 9000XLT on sale for $344.95. These are excellent prices, the cheapest I've seen, and they are excellent radios - I own one of each.
Communications Electronics is a 1-800-USA-SCAN.
If this is still out of your price range, then Sporty's Pilot Shop in Batavia, Ohio, is bringing out a new handheld VHF/UHF airband-only scanner for $150.00. It should be available in May, but it only has 20 memory channels, not enough for serious monitoring, but OK for an airshow.
Otherwise, it's time to look for a used radio.
For handhelds I would suggest looking for a used Radio Shack Pro-43, Pro-26 or Pro-60, or Uniden 2500XLT or 3000XLT. For table models look for Radio Shack models Pro-2004, -2005 or -2006; Pro-2035 or -2042; or Uniden 9000XLT.
I would stay away from the Uniden 890XLT and its twin, the Radio Shack Pro-2036 because both suffer from terrible intermod problems.
If you are seriously interested in monitoring military aircraft then I would suggest that you join MilCom, the military communications listserver. To join milcom:

Send e-mail to: majordomo@grove.net
Leave the subject line blank, or type: milcom
In the text area type just: subscribe milcom
Do not use a signature or tag line.

Hope this helps some,

John

3700. Re: HELP BC9000XLT

Newsgroup: rec.radio.scanner
Date: 1997-02-28 00:00:00 UTC
From: jtward11@aol.com
Message-ID: <19970228055300.AAA28090@ladder02.news.aol.com>
Source record: 205690

You are right about the 9000XLT being more sensitive than the 2035.

Try using the attenuator on the channel with the weaker of the two frequencies. Using it on the channel with the stronger freq. programmed will only reduce the signal on that memory channel. It will not effect the signal strength of that transmitter on other channels. By using the attenuator on the channel with the weaker freq. you may reduce the bleed over to a point below that of the proper frequency. Be sure to set your squelch to a normal position, not full on.

Let me know if this helps.

John

I am sorry if anyone, especially police officers, mistook a statement in my
original message post.

EXPLANATION:

In the original post, I said that scanners help keep those who are sworn
to serve and protect us in line (Not that there aren't many WONDERFUL cops out
there anyway).

Translation: Scanners help keep those who are sworn to serve and
protect is in line. (THERE ARE MANY WONDERFUL POLICE OFFICERS
OUT THERE ALREADY!!! THERE ARE MANY POLICE OFFICERS WHO
DO NOT HAVE TO BE KEPT "IN-LINE"!!! THERE ARE MANY WONDERFUL
OFFICERS WHO SERVE THE PUBLIC WELL ALREADY!!! THERE ARE
TONS OF GREAT POLICE OFFICERS WHO TRULY DO SERVE THE
COMMUNITY ALREADY, WITHOUT HAVING TO BE SCRUTINIZED BY
SCANNER LISTENERS!!!!)

The post was not intended to bash police officers at all. There are many
great officers out there. In fact, I was in a boyscout explorer post
when I was younger that involved police officers!

If I had intended to bash cops, I would have made it VERY clear.

I was actually paying the GOOD police officers a compliment, not an
insult!

I'm about to buy a handheld scanner (probably a SC-150B or perhaps I'll go all out and get the BC 3000XLT or the IC-R10). Mail order seems okay, but if anyone in Chicago and/or North Shore knows a decent local place to buy, I'll go for that too.

Best Buy's SC-150B is too expensive; RS, well, RS is RS, and I am not impressed enough to go for them (IMHO, and please, no flames nor do I intend to flame) though its Pro-25 seems decent in its price (I need specs, BTW). But actually, if anyone's heard of Joseph Electronics, can you tell me if they sell scanners - I know its close by to me, but I never have the time...

Please advise for a decent vendor...my BC 60XLT is sooooooooooo limited...

Thanks in advance for a novice!

Tom

Tommy,

Communications Electronics has the 3000XLT on sale right now for $329.95.
That is an excellent price for an excellent radio. Their number is
1-800-USA-SCAN. Good luck.

John

Dear Sir -
I'm not sure how you define a "power happy pig," but the last time I checked, the proper title was Law Enforcement Officer. Now, sir, it would appear to me that you were, in fact, BREAKING THE LAW! So, sir, if you think that receiving a ticket for a speed infraction denotes that someone is a "power happy pig" then I do think you may need a head examination. As for your experience with the officer mistakenly putting the incorrect time on your cite, well, he made a mistake. And so did you. And you both got caught. Next time, I doubt you'll be as lucky. Why not think about what would have happened if that officer wasn't in that used car lot, and he

hadn't pulled you over for traveling at seventeen miles an hour over the posted limit? What if, upon approaching a stalled car with no lights, you hadn't seen that stalled car until it was too late. You might not have been able to fight that with the judge. Sir, I would suggest you stop calling police officers "pigs" because they want to protect you and your property, and perhaps you could start treating them with the same respect you would afford to a customer, or your boss. Next time you may just get a warning.

I also bought the Pro 60 for $199.99. The 60's lack of sensitivity meant I couldn't receive two of the local police frequencies on UHF Hi, that I monitor. I returned the 60 and purchased the Pro 26 which is on sale for #349.99. The Pro 26 receives the frequencies I couldn't receive on the 60. The 60's lack of sensitivity may not be a problem for some, for others it may be.

> Thanks for the replies...

Chris,
The 5uv spec for the Pro-26 is for Wide FM mode which will only be
used under normal circumstances for listening to TV audio frequencies
and FM radio. 5uv sensitivity is not that great...but then you're
listening to signals that are pumped out in great power compared to
the normal FM signals for police, fire, etc.
If you're worried about your antenna pick-up, put on an extendable
whip or a ham-transceiver type made for 2m/440 dual-band operation.
That should help you pick up weaker signals!

Good advice John.

I would like to point out that the BC9000 is very sensitive in the
150s. Couple that with poor selectivity(I've never been very
happy with this on Uniden models) and you've got the above
mentioned problem. They should back off the sensitivity and/or
adjust their filter.

I prefer the BC9000 for VHF lo & hi, is terrible on VHF aero,
does OK on UHF aero and 450/460s, and OK on 800MHz. I prefer
the 2042 if I do work in VHF/UHF aero or 800MHz due to its
improved sensitivity and good selectivity. Then there's the
2006 which seems to do everything great!

last changed June 3, 1996

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)

Lorin,
The UHF military air band(225-400MHz) is only covered in higher-end
(read most $) radios. Radio Shack has the Pro-60 on sale for $200 which
is a great deal and this radio covers this band, as well as many other!
Probably your best bet for getting a quality, new receiver at a good
value price.

group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code? |
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies. It's clear from the discussions posted on the Internet that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a

diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz

band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code? |

There are a few ways to determine the CTCSS or DCS code | transmitted by a station: |

1. Use an outboard CTCSS/DCS reader which must be | attached to the discriminator output circuitry inside | the scanner. The reader has an LCD or LED display | which indicates the code when a stations transmits. I | use a CSI model CD-1 Communications Decoder Unit, an | an excellent reader which sells new for about $200. | (Connect Systems Inc., Ventura, CA, 800-545-1349, | www.connectsystems.com). |
2. Many of the ScannerMaster guides, as well as scanner | club newsletters, print the CTCSS codes used by | transmitting stations. |
3. On some scanners equipped with the CTCSS squelch, you | can program into memory the frequency of interest. | Then you "tune" slowly through all the different CTCSS | and/or DCS codes until the squelch opens and you hear | the dispatcher talking. This is a slow process and | the station has to keep transmitting during it. |
4. A slow, brute force method is to program the same | frequency but a different CTCSS code into several | channels and see where your scanner stops. |
5. In some cases, I've actually examined the walkie- | talkies I want to monitor and found the CTCSS code | printed on a label on or inside the radio. |

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other

bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove.net

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $2.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of the $2.00.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins

Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain selected business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency

lists are often found in club publications, not commercial magazines, and are discussed later.

The Scanner Club is the name of a bimonthly magazine published by Les Mattson. It is a successor to the Northeast Scanning News and is the official publication of The Scanner Club, a not-for-profit club organization. TSC's main strength is local frequency information, including CTCSS codes. Sample issues are $4 each. A yearly membership costs $24.95 and includes 6 issues. Write to The Scanner Club, PO Box 62, Gibbstown, NJ 08027 for more information.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of

interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting.

Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's

"search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.theramp.net/shabec/carma.htm |

The club's mailing address is:

CARMA
P.O. Box 2681

Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $13. Police Call Plus is

basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is expected soon and will be available from Grove Enterprises for about $30. This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's

book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US.

However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. Rich Barron maintains an interesting site at www.exo.com/~rbarron.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the

FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or

anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the

channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a

receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to
him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the
"instructors". Mystery solved; I had been monitoring the
customer training center for a large computer manufacturer.
The training center has hotel rooms and dining facilities
to accommodate students from out of state. As a
convenience, shuttle van service is provided to local
shopping malls.

Summary

Through books, government records, and radio clubs, scanner
listeners can make use of frequency information compiled by
others. Two-way radio users often fail to identify their
transmissions properly, making it more difficult for
listeners to know who they are monitoring. By examining
radio equipment labeling, and monitoring and taping
transmissions, scanner enthusiasts can unearth new
information.

group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
60 old and new scanner radios and monitor receivers. Other
topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase

most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units

unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The | GRE-manufactured SBE Optiscan (and its Sears clone) required | poking or covering a series of holes in plastic cards which |

were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some | good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews and modifications of these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT|
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Oct 1996 - Radio Shack PRO-2046 mobile
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10

Note: Reprints of Monitoring Times articles are available for $2.00 each (plus self addressed stamped envelope) from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this $2.00.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features | than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity,

attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996.

ICOM

R-10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat

250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to | moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great | searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997.

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency

of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of

preprogrammed channels Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat

BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT

Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz

band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004

Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob | Parnass, AJ9S, in Monitoring Times, February 1997.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission. See September 1996 Monitoring Times for modifications.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider

frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner

crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by

the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the

locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 5A95, means the scanner was made in the 5th month of
1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Schematics, Owner's Manuals, and Parts Available

Service manuals for most Radio Shack scanners may be
ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a
Photophacts from Howard Sams Publishing division of

Prentice-Hall at (800)428-7267.

Parts may be ordered through your local Radio Shack store
or through Tandy National Parts, telephone (800)442-2425.

G & G Communications (telephone (716)768-8151) is a family
owned company which repairs scanners and stocks parts for
several older models, especially Electra/Bearcat and
Regency brands, but they don't sell manuals or schematics.
They are located at 9247 Glenwood Drive, LeRoy, NY 14482.
(http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or
ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022,
PRO-2004, and PRO-2005/6 is implemented by an
electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is
designated EL-501, and is identified by Radio Shack part
#10800050. A new EL panel can be ordered through your
local Radio Shack store and sent to your home for about $12
plus shipping. Radio Shack no longer sells replacement EL
panels for the PRO-2004.

Replacing the backlight is an operation which requires care
and patience. The service manual has an exploded parts
diagram which is helpful in showing how to disassemble the
scanner.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables,
e.g., PRO-39 and PRO-43, can become unreliable after
prolonged use. The best repair is to replace the rubber
keypad instead of trying to restore contacts using
chemicals. A replacement rubber keypad may be ordered
through your local Radio Shack Store for about $4.00.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part
#EAS-3P123A). The voice coils in some of these speakers
have opened, resulting in lack of audio output, though
audio is still available from the earphone jack. A more
capable 500 mW speaker is available through Tandy as
replacement (EAS-3P127).

That's quite a range of radios to be considering!

You won't find many good deals at local shops unless you come
across a sale at Radio Shack(which they seem to be having
nationwide this week). Mail-order with a reputable company
is the way to go these days for almost any purchase.

Speaking of sales at Radio Shack, both the Pro-60 and Pro-62
are on sale for $200 & $180 respectively. The Pro-60 is a great
deal for this price considering its 200 channels, wide coverage
with wide-FM and triple-conversion.

For a feature packed rig, the BC3000 would probably be just
the thing for you if you can swing the low $300 price range.
Try Communications Electronics in Ann Arbor, Michigan at
1-800-USA-SCAN...know someone who just picked up a BC3000
from them and got a free second ni-cad.

And I would staw away from the R10. Great little radio but it
is not a "scanner" in the pure sense.

And just for your personal edification, Uniden makes quite a few
of Radio Shack's scanners these days.

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 |
- 42 and 42 - 54 MHz. |

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s | use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built

in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service for the Plectron P1 and R700 models is

offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal
Signal in University Park, IL, phone (800)524-3021. You
can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone
(800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know

if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold.

That's an attempt to limit the current drain on weak NiCds
to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board,
adjacent to the black multi-pin connector which mates the
Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily,
by something in the scanner drawing too much current
through it. In one case, capacitor C36 shorted. It's a 220
uF 10v electrolytic, located on the component side of the
main board, connected from pin 8 of the audio IC (IC2
NJM386SL) to ground. Capacitor C55 shorted in another
BC200XLT. In a pinch you bypass Q201 by soldering a short
piece of bare wire between the collector and emitter, but
you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity |

John Ward has fixed two BC9000XLTs which suffered from "low |
sensitivity." He fixed the solder joint where the antenna |
jack connects to the circuit board. In both cases the tab |
from the board was on the opposite side of the jack from |
where the little blob of solder applied at the factory was |
located. |

It was an intermittent problem that depended upon the |
position of the antenna cable - if the weight of the cable |
placed tension on the jack in one direction contact was |
made and the radio worked fine. If the cable placed |
tension on the jack in the opposite direction contact was |
lost and so was reception. The gap was barely noticeable. |

Other Problems

Complaints of low audio output and occasional microphonics
in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd
electrolytic capacitor in series between the external
speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder
connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier
activated relay inside the BC890XLT wore out. Andy found
the identical relay sold at Radio Shack (part #275-232) and
says the BC9000XLT uses the same relay, too.

Point well taken, Fred. I am, in fact, comparing it to the AR8000 and
BC3000 for sensitivity and overall signal reception & selectivity.

Strong signals,

HAMFEST/COMPUTERFEST CALENDAR 1997 - NORTHERN ILLINOIS
last updated February 8, 1997

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale and ARRL for providing some of the information.

MARCH 1997

Mar 2 (Sun), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Mar 9 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Mar 9 (Sun) - Waukesha, WI. SEWFARS Swapfest. Waukesha County EXPO Center, Waukesha, WI 8:00 AM Talk-in on 146.820 pl 127.3 $4.00/$5.00 Ham Radio. Computers. Electronics. Amateur License Exams. For information Contact SEWFARS, PO Box 102, Delafield, WI 53018. 414-650-0724

March 23 (Sun): Grayslake, IL - LAMARS hamfest, Lake County fairgrounds. All indoors. Admission $5 at gate, free parking. Setup at 6 AM, doors open at 8 AM. VEC testing 9 - 12. For Information contact LAMARSFEST, 650 Green Bay RD, Lake Bluff, IL 60044. (Small fest, but usually interesting - AJ9S.)

APRIL 1997

Apr 13 (Sun), Chicago, IL - CARC Ham Auction. DeVry Tech, 3300 N. Campbell Ave. Will auction your electronic goods at this auction if you bring them in before 12 noon. All goods subject to 10% donation. If purchased back by the sell, then 5% will be due. All sales as-is and final. Info: Dean (708)331-7764 or George (312)545-3622, days.

Apr 19 (Sat), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Apr 20 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Apr 27 (Sun), Arthur, IL - Moultrie ARK. Contact Ralph Zancha, WC9V, tel (217)873-5287.

MAY 1997

May 3 (Sat), Cedarburg, WI - Ozaukee Radio Club Swapfest, 8:00 AM. Circle B Recreation Center, Intersection of HY 60 and Ozaukee Cty I. Talk-in on 146.37/97 and 146.52 $4.00 Amateur License exams. Amateur Radio. Computers. For Information Contact O.R.C. Swapfest Committee, W58 N985 Essex Dr, Cedarburg, WI 53012-1439 or call Gabe at 414-377-2784 between 6:00 and 8:00 PM.

May 4 (Sun), Sandwich, IL - DeKalb KARK Hamfest. Sandwich Fairgrounds at Suydam and Gletty Roads. Admission $6. Overnight camping on grounds $10. Talk in 146.73 or 146.52 MHz. Info: Bob Yurs, N9ZNA (815)895-3219 or n9zna@aol.com. Web page: www.tbcnet.com/~jleonard/hamfest.htm (Good, medium sized fest which grows each year. Good restroom facilities. Few commercial exhibitors. - AJ9S).

May 10 (Sat), Peotone, IL - Kankakee Area Radio Society hamfest. Will County Fairgrounds. I-57 to Peotone exit 327 (east). 6 AM. Admission $4. Talk in 146.94 MHz. Info: Willis Bowser, K9IFO (815)472-2079.

May 18 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

May 25 (Sun), Chicago, IL - Chicago ARC. DeVry Tech, 3300 N. Campbell Ave. Admission $5. Info: (312)545-3622 or (312)486-6823.

May 31 (Sat), Springfield, IL - The Sangamon Valley Radio Club. Illinois State Fairgrounds. This Hamfest is "rain or shine" with over 100,000 square feet of covered and lighted fleamarket space, plus indoor facilities. Info: Don, W9EBK at 217-789-4519.

JUNE 1997

Jun 1 (Sun), Princeton, IL. Bureau County Fairgrounds. Free parking. Info: Debbie Burton, N9DRU, 1153 Union St., Marseilles, IL 61341-1710, tel. 815-795-2201 (Usually an excellent hamfest, with sellers from Illinois, Iowa, and Wisconsin. - AJ9S.)

Jun 8 (Sun), Wheaton, IL. Six Meter Club of Chicago. DuPage County Fairgrounds, 2015 Manchester Rd. 7 AM. Admission $5. VEC tests 9 AM - 1 PM. Talk-in on 146.97 MHz (107.2 PL) or 146.52 MHz. Info (708)442-4961 or contact Joe Gutwein, WA9IRJ, (630)963-4922.

Jun 8 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Jun 22 (Sun), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

JULY 1997

Jul 13 (Sun), Sugar Grove, IL - Fox River Radio League, Waubonsee Community College, Rt 47 at Harter Rd. 6 AM. Admission $5. VEC tests 10 AM only. Talk in 147.21 (pl 103.5 & 107.2 Hz) Info: Diana, WD9API (630)293-7485.

Jul 26 (Sat), Pecatonica, IL - Rockford Amateur Radio Assoc. (RARA) Amateur Radio and Computer Hamfest. Winnebago County Fairgrounds, about 15 minutes west of Rockford, Il. Talk in on 146.61 MHz, 114.8 Hz PL. This will be in the main exhibition hall with room for tables. Ham Radio Vendors, Computer parts vendors, tailgating, food. Code receiving contest, Throw the Radio contest, Great door prizes. For table reservations contact Mike Anderson at (815)397-4304 or mander5@ix3.ix.netcom.com. For any other information contact Marsha Plasters at (815) 399-9233 or wa9ffl@aol.com.

AUGUST 1997

Aug 16 (Sat), Franklin, WI - 7:00 AM, C.A.R.S. Crystal Ridge Ski Lodge. Talk-in on 442.200+ pl 100.0 / 146.52 simplex $4.00/$5.00 Radios. Computers. Electronics. Concessions. Door Prizes. Free parking. Free camping. Large Tailgate selling area. Electricity available, $1.00. Contact C.A.R.S., PO Box 325, Franksville, WI, 53126-0325. 414-325-7427

Aug 16 (Sat), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Aug 24 (Sun), Woodstock, IL - Tri-County Radio Group. McHenry County Fairgrounds, Rt. 47. 6 AM. Admission $5. Talk in 146.52 MHz. Contact Bob Grosse, N9KXG. Info (voice/fax) (847)658-1678. http://www.angelfire.com/il/tcrg/ (Smaller, but fun fest. - AJ9S)

SEPTEMBER 1997

Sep 27 and 28 (Sat & Sun), Grayslake, IL - CFMC's Radio Expo 97. Lake County Fairgrounds, Rts 45 & 120. Admission $6. Talk in 146.76 MHz. Info (708)457-0966. (This is probably the biggest and best hamfest in N. Illinois - AJ9S).

NOVEMBER 1997

Nov 15 & 16 (Sat & Sun), Fort Wayne, IN - Fort Wayne Hamfest. Indiana ARRL State Convention. Allen County War Memorial Coliseum Expo Center. Sponsored by the Allen

County AR Technical Society. Admission $5. Parking $2.
www.pipeline.com/~dagagnon/. Info: (219)484-1314.

NOTES - Computer Central and Giant Computer shows

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm.

Giant Computer shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $5. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123.

>you DID lie to the cop, yet you say you aren't a criminal?

Yes, I did break the law and yes, I did lie to the cop. I am such a terrible guy and a threat to society. Lock me up and throw away the key.

Do you
>sneak around the neighborhood at night and look into peoples' windows?

uh, huh huh huh huh huh.....like...no...huh huh huh huh huh huh

>If the demos are responsible for keeping people like you with nothing
>better to do from eavesdropping on my personal business, then yes,
>thank you dems, for at least attempting to protect our rights to
>privacy from voyeurs like Tyler.

Oh, now I'm a voyeur? Websters has voyeur as:

Voyeur: n: one who habitually seeks sexual stimulation by visual means.

Sorry pal, but I don't get my rocks off (literally) by listening to the scanner. Your right to privacy conflicts with my right to listen to the rf spectrum which you are a part of. Your right to privacy was bought by the cellular industry. Notice, they didn't make the cellular system private, they said you (I) just can't listen. Why didn't they actually make it private by the use of a scrambling system or maybe even go digital? What's wrong with digital? COST. Apparently, it was less of a financial burden to buy a law that makes it illegal to listen to cellular conversations than to actually impliment new hardware that would make it literally impossible to listen to.

The cellular privacy law is analogous to a law that instead of making seat belt use mandatory, you now have a law that says you are not allowed to get into an accident. Strange isn't it.

If you see me as such a threat, why don't you come to my house and take my scanner. After all, I am a hardened criminal and a voyeur.
Tyler

I picked up a copy at a recent Hamfest. I wasn't impressed.

Well I have one these, and since the cord is mounted inside the case (no AC adapter needed), you would probably have to buy one of those deals that you plug into your cigerette lighter & is like a powerstrip. Apparently these things will allow you to run your normal AC powered stuff from your cars battery. This is not a testimonial, I have never tried it, but its the only thing I can think of.....

Hey Rich,

Is that me?

That second battery offer made my decision. Couldn't let a deal
like that get away. Even though the shipping was $17 for UPS ground
Comm Elec still had the lowest price. Then when they added the free
2nd Ni-cad. Wow!

> would be greatly appreciated.

Scott,
As for purchasing a worthy antenna, I would recommend a
good extendable whip. There are several from Smiley who
advertises in AES that should do well. I am using their
Super Stick IV on my R10 to help in reception in certain
bands. Collapsed this antenna is about an inch shorter
than the R10 stock. And it extends to about 18".
The stock Icom antenna does not do justice to most of
its SW coverage, nor for most of the VHF hi band. I hope
to post my impressions of this radio within the next few
days.
Good luck with your antenna quest and let us know how
you make out!

Ed,

Troop D and E are now part of the Troop Trunked Radio system. They use
the frequencies for each troop system, example, the NJTP Moorestown
patrols use the Troop A trunked system frequencies.

The older 150 Mhz frequencies for TP and GSP are now gone.

3749. Austin Spectra Antenna - Helpful Hint

Newsgroup: rec.radio.scanner
Date: 1997-03-01 00:00:00 UTC
From: fkelcz@facstaff.wisc.edu
Message-ID: <fkelcz.217.000C423B@facstaff.wisc.edu>
Source record: 205487

I have owned an Austin Spectra for about 2 years, but never bothered with the top element cutting chart included with the antenna, thinking that this was only important for transmitting applications - WRONG!!!

Found that for 46 Mhz signals, shortening that element from the supplied 15 inches to 5 inches increased signals by 3 - 4 S-units measured on an R7100! Signals went from unlistenable to almost quieting. Checked other freqs in the VHF Hi, UHF and 800 band - no effect. This slight change has enormously improved this antenna!

Mike,
You have or have used an R10 right? If you had to choose
either the WS-1000 or the R10, which would you pick? I have
not used the WS-1000 but I think I would pick the R10 for
overall features and construction quality. Granted it's a
little bigger and a little more money, but I think it would
be worth it.
Another question, how is the antenna on the 1000? Overall
is it good or bad? I would give the R10s a good rating
overall. Granted, it sucks for SW and VHF hi, but then one
antenna can not be all things.
I am interested in your thoughts on this if you would
please? Thanks!

Fast Food frequncies are the same across the entire USA.

The most common frequency pairs to check are:

30.8400 --- 154.5700
31.0000 --- 170.3050
33.1600 --- 154.5100
33.4000 --- 154.5400
35.0200 --- 154.6000
154.5700 --- 170.2450
154.6000 --- 171.1050
457.5375 --- 468.3875
457.5500 --- 467.7750
457.6000 --- 467.8250
461.0375 --- 466.0375
460.8875 --- 465.8875
461.0875 --- 466.0875
469.0125 --- 464.0125

If they're using "3M" or "GM" headsets then you need to search
from 920-922 Mhz Wide FM for the speaker frequency and from
903-905 Mhz Wide FM for the headset frequency.

An ariticle on Fast Food monitoring appeared in the August 96
issue of Monitoring Times. It can be view online at the
following URL http://www.grove.net/fastfreq.txt

This list covers most Fast Food chains across the entire US.

3756. Shouting out backdoor.....

Newsgroup: rec.radio.scanner
Date: 1997-03-01 00:00:00 UTC
From: hamilton <hamilton@dimensional.com>
Message-ID: <33187827.425A@dimensional.com>
Source record: 205494

I have been reading with amusement all of the right-to-privacy
and cell phone calls.

Technology of any sort gives you more than you realize.

If you stand at your back door shouting while your on the phone
of course everyone will hear you, and you feal foolish about what
you have said. (you have no one to blame but yourself)

Technology in a cell phone is the same, you get more than you realize.

You have a right to 'shout' your phone call on the _PUBLIC_ air waves
and we have the right to pickup those shouts. If you feal foolish
about what you have said - you have no one to blame but yourself.

If you want buy a cell phone, be sure it has some form of security.

IF it does not (because your to cheap to buy a good unit)
you have no one to blame but yourself.

hamilton

I just started using a RS "improved" magnet mount CB antenna for mobile use with my AR8000. It is a "cellular look" antenna that sells for $32.95.

Results so far;

1. Much better low frequency response (26-54 Mhz). Though the s-meter doesn't show much more signal, the audio is clearer, with less static. McDonalds drive-up (35.02 Mhz) & cordless phones that barely broke squelch before now come in clear.

2. UHF frequencies seem as good as they were with the previous "all-band" antenna.

3. 800 Mhz range seems less prone to overloading. Less clipping of the audio.

4. The only negative so far is slightly less signal in the VHF high band.

He was quite right. You may freely listen to cordless phone calls but you are not permitted to divulge the contents. Cordless phone phone frequencies are not blocked from scanners.

> Dr. Pepper
> Good ALL the time:]

The state of California has already had the most restrictive gun control laws in the nation on the books for over 20 years, and statistics prove that it has not done ONE BIT OF EARTHLY GOOD!
Gun crime has not decreased in California since the 20 - odd years ago that these laws went into effect.
It is not the LAW - ABIDING gun owner that they need to worry about. The LAW - ABIDING gun owner is not the one perpetrating these crimes. However, that is exactly the segment of the population that these laws are aimed at.
Criminals do not bother to apply for the proper papers, nor are they interested in obtaining the pertinent State or Federal permits. They will obtain guns, and these laws make it a lucrative business to supply these guns at huge profits for the black marketeers and criminals that make a living at it.
Society does not understand the problem, nor the solution. The solution is to spend the considerable money, time, and man-power to simply enforce EXISTING STATUTES that would prevent the criminal from obtaining the gun or supplying the gun. Society does not want to do this. We can expect more of these "feel good" , do - nothing laws in the future. Why are innocent, upstanding citizens mugged, raped, beaten, and murdered on the city streets every day ? Because these stupid FEEL - GOOD laws have ensured that the entire city is full of UNARMED VICTIMS and ARMED CRIMINALS ! Remember, the Police are in the VICTIM business ! These laws are in their interests! They can have a whole city full of VICTIMS, and then point to an increased need for their presence, and an increased need for funding , etc, etc, etc, ad nauseum.

" How do you conquer a society ? Get their children intested in sex, drugs, etc. Push gun registration, with an eye to later confiscation of the firearms. Make sure you keep evedryone focused on tangental issues which have nothing to do with what is really going on."

:can't tell anyone what your heard, because there is a federal penalty
:for that.

Untrue. The federal penalty does not prevent people telling what they
hear.

:There is also a question of what you can do with it. If
:one person gives you permission to use it, the tape can be introduced
:as trial evidence in Wisconsin. A radio station can put a tape on the
:air if it gets the permission of the taper and the tapee.

The radio station can put a tape on the air without any permission.

:If they are
:half of that, they only have to get permission from the tapee. In the
:early days of home portables there were many cases of police busts
:using reports from home portables as evidence in court. I think that
:is still alright, though it would seem to be on a collision course
:with the 86 federale law prohibiting the divulging of any infor heard
:on a portable call. Probably, this little inconsistency has not been
:tested in the courts. If we civilians can't tell anyone what we hear,
:why should the cops get special dispensation to blab it as evidence
:in court.

We can tell anyone what we hear. We may not tell anyone what we hear.

> hunk of crap! It don't work worth a damm!"
> "Ya, my radio keeps losing calls too...")

Wyatt,
My comment was not about the paging transmitter interfering
with the data channel, I was referring to the BC230's front-
end filtering and dual-conversion nature which allows the
strong pager transmissions to interfere with normal reception
of the trunked data channel(as well as cell images) inside of
the radio itself.
I know when monitoring trunked systems in certain areas
around where I live, I will get lots of intermod(pagers
and cell freqs mixing together and coming through on a
normal public safety frequency) when using any dual-
conversion scanner like the BC230, Pro-51, etc.
If a scanner has front-end filtering not up to snuff, or
uses double-conversion which will allows imaging to occur,
you run the risk of interfering with the reception of any
frequency inside the radio. Since the BC235 is based off
the BC230, I believe it will be dual-conversion and give
many of us problems when monitoring in rich RF areas.
Since the BC235 is constantly monitoring the data channel,
should a strong image come through on your data channel or
two strong frequencies combine to overload the front-end
and come through on your data channel, all you will get on
the data channel is garbage. If the data channel can't be
interpreted correctly due to this noise, the BC235 will

revert to being a BC230, or possibly even worse; as the
old computer saying goes "Garbage in = Garbage out".

Suffolk County is a Motorola System and will work with a Bearcat Trunk
Tracker. I believe it will stay analog with digital encryption on
Intelligence and Narc units only. They're halfway through the switchover
and are simulcasting on 155 and 800.

3782. Opinions on PRO-26

Newsgroup: rec.radio.scanner
Date: 1997-03-01 00:00:00 UTC
From: tcoles@tor.hookup.net
Message-ID: <5fa8pk$8l0$1@loki.tor.hookup.net>
Source record: 205520

I was wondering what users of the PRO-26 thought of it? It is currently on sale here in Toronto, and I am thinking about buying as a back-up/2nd unit to my AOR AR2700. It has good coverage (cell blocked though - damn American laws!), some good features. Any thoughts?

Thanks

Todd

Unauthorized reproduction of this work, in whole or in part, without the expressed, writen consent of its creators could be construed as an act of war, and would therefore be subject to retaliation ...so just don't.

I have a PRO-26 and wouldn't trade it for anything. It doesn't receive
cell pgones but I'm not interested in that anyway. I also have an
AOR1000 that does receive cell phones that is for sale for best offer.
It's only two years old. A divorce caused the sale...

3789. antenna question

Newsgroup: rec.radio.scanner
Date: 1997-03-01 00:00:00 UTC
From: Jeff Voyles <scanner@204.248.93.13>
Message-ID: <3318E210.5B88@204.248.93.13>
Source record: 205527

I have 2 antennas (all-band ground plane & 860Mhz yagi) on the same mast
and each has it's own coax running into my house. I have 2 scanners I
want to connect them to (a Pro-2026 & my new BC 9000xlt).
What would be the best way to connect both antennas to both scanners?
I'm using RG-6 with f connectors, (the best I can afford at this time).
Thank You for any advice!

Radio Shack's Pro-60 probably will, and it's on sale right now for
$199.95. That's $180.00 off of it's catalog price. I bought one a
couple of days ago and am enjoying it immensely.

I wondered across this web site a couple days ago. If you are interested in aircraft freqs this is a great resource. All you have to do is enter the city and name of airport in the search engine and "POOF" freqs for tower, takeoff, approch, and many more. The site does appear to be a little slow though.

I'm considering going to Rat Shack and getting the Pro 60 now that it's $200. My question is this: Are there any interesting military air freqs in any of central FL? McDill AFB is in Tampa, but I've heard there's not much activity there. In case anyone's wondering, I live in CENTRAL central Florida--right in the middle of what's termed central Florida! :) I often travel to the Kissimme/Orlando area, however.

> that an analog cell phone users call is private?

Looks like they hired a new marketing strategist. Just think about it:

Alltel tells their customers they are trying to 'make' the government pass new laws, their customers who don't really think the government will be able to control this problem will ask ALLTEL what they can do to ensure their privacy, then ALLTEL responds 'Well you can upgrade to our digital phone for only (two or three figures) and will be worry free!'

I doubt the government will do much about this since it is a moot point anyway. In my area within the last few months, there have been almost a dozen PCS systems building their infrastructures. That doesn't even count the existing cellular companies! So, cellular will soon be as popular as IMTS. Speaking of IMTS, I wonder why that was never banned when it was *THE* mobile phone carrier ???

If they want to start a letter writing campaign, so can we. Write your reps and tell them that they should not waste YOUR tax dollars on these useless laws. The existing laws are sufficient, and the only way to ensure interception, both intentional AND ACCIDENTAL (Not covered by ECPA!) is to require digital technology. But then again, the CTIA and PCS industries have already done this themselves! So, they need not

waste their time and your money playing 'catch-up with technology' when making laws.

Tell someone they can't do something, and they will have more incentive. Make it impossible (or close to it) for them to, and they won't.

Montgomery Ward's models were based on the Bearcat 210 series scanners.
This includes the 210, 210XL, 211, 220, Etc. For a manual, just compare
the specs of your scanner with the specs of these others.

http://www.ggw.org/nf2g/index.shtml has a listing of specs (I think)

You forget that even if they had done this, their relatives would simply
step in as the plaintiffs. You would still have all the trials, lawyers,
etc. What you would save on is the 'storage' of these criminals until
the trial came up.

>be worth it.

The R10 is a lot bigger, really; in my book these are competing for
different market niches. If I had to put them head to head - with that
disclaimer - I'd say the Icom is a better radio.

> Another question, how is the antenna on the 1000? Overall
>is it good or bad?

It is designed to be tiny like the radio, so there are compromises. It's
OK on 800 and UHF, half-deaf on VHF hi, and completely deaf on VHF-lo. But
you can put anything there in its place ... I **NEVER** judge a radio
based on the $5 duckie that it comes with ... that's plain stupid. It's
like judging a personal stereo based upon the $10 headphones packed in the
box.

> I would give the R10s a good rating
>overall. Granted, it sucks for SW and VHF hi, but then one
>antenna can not be all things.

The R10 antenna is pretty good for a stock duckie.

For Sale...
I have 2 Heathkit ID-5001 computerized weather stations
for sale.

The first unit is still in kit form. The second unit is built.

This station is capable of measuring wind speed, direction, temperature,
with optional
indoor/outdoor humidity sensors, RS-232, and rain guage.

The built unit has no sensors, and the kit is missing a couple minor
parts that can be obtained at any electronic store.. Either combine the
2 units to have one working, which means you have spare parts or
purchase the missing sensors, and have 2 working units..

The reason for selling is MOVING...need the bucks, otherwise they
would never leave the shack!

No reasonable offer refused...

I have found the Scanner Master books to be better than the Police Call books. Scanner Master costs more (usually found for around $35 or so) but contain much more information, such as individual unit numbers (fire/police/EMS units), individual agency codes (ten-codes, etc) and even in some cases how the agency operates. They also have maps when available, as well as a whole section dedicated to railroads, utilities, aviation, amateur radio, marine, military, government, and other frequencies. Problem is the books cover only a very specific region, and most of the country isn't covered yet. A lot of the big cities are covered, along with their surrounding areas. Good luck!

Bobby

> help me???
>

The key to getting the radio to enter the "internal system alignment"
mode
seems to be having VFO A set to a frequency in the 144-148 band, and VFO
B
set to a frequency in the 430-450 band. It refuses to enter this mode
if
you have other frequencies in place, or even if you have VFO A set to a
70cm frequency and VFO B set to a 2M frequency. Weird, but true. There
are 9 different settings for the VHF mode, and the same 9 setting
options
for the UHF mode. With your VFO's set as mentioned, if you tune to VFO
A
before turning off the radio and then entering the alignment mode, you
get to set the VHF values. Then tune to VFO B, turn off the radio,
power
it back up with the magic 3 buttons pressed, and set the UHF values.

Be V E R Y careful with the settings. Some of them do NOT work the
way
you might imagine, and I managed to screw up my radio for awhile because
of it. For example, if you select the S1LV (S1 level) or S9LV (S9
level)
options, you can twiddle the knob all you want, and you CAN'T change the
numeric value that the radio is displaying. Consequently, since I had
VFO A tuned to 144 MHz and there was no signal present, I managed to set
my S9 level equal to ambient RF noise level. Thereafter, every 2M
signal
(and many non-signals) registered S9 on the LCD bargraph. After much
frustration, I determined that the way you set those two items is to
tune

in a signal of the strength that you want to register as S1 or S9 respec-
tively, and THEN enter this mode. Of course, that requires that you find
the signal and tune it in while the radio is in normal operation mode,
THEN turn it off, then hold down the PTT, lamp, and knob, while turning it
back on. And hope that while you fussed with all that, the signal you want
to use as your S1 or S9 reference level is still around at the same strength
and same frequency. (I presume that the PROPER way to do this is with
test gear that allows you to generate the signal yourself, but I had to
improvise.) Fortunately, my S meter is working reasonably now, but I'm
pretty sure I still have the squelch settings a bit screwed up on the 2M
side. Sadly, even a "master CPU reset" doesn't restore those settings to
factory presets, or any other reasonable values...

After much hunting around, I finally found a reasonably-priced (about $100)
VHF/UHF SWR and power meter that has a 5-watt full-scale range. It is an
NCG-3000. I discovered that even with the FNB41 battery pack, or with the
13.8V automoble power cord, my FT-50r was only putting out 3.5-4.5 watts
on the high power setting, and the other power levels were also on the
skimpy side. I tweaked all 8 levels (L1, L2, L3, and HI for VHF, and
the same 4 for UHF). The "bad" news is that even when set to the maximum
value (255 arbitrary units), I still can't quite hit 5 watts on UHF,
only about 4.5 watts. On VHF, the max setting puts out between 4.5 and
6 watts depending on the exact frequency within the 144-148 band you're
on. I have noticed that now that I have the HI power setting cranked up
to (or almost to) the rated 5 watt value, the radio gets noticeably warm
during long conversations. I hope that's not a bad sign. (No, it's not
heating up because of a large amount of reflected power from a poorly
matched antenna. The antenna in my car has an SWR of 1.2:1 at the 2M
frequencies I use the most, and at its worst, an SWR of 1.4:1 at around
440 MHz. Most of the power is going in the correct direction!)

Jeff Voyles (scanner@204.248.93.13) wrote:
: I have 2 antennas (all-band ground plane & 860Mhz yagi) on the same mast
: and each has it's own coax running into my house. I have 2 scanners I
: want to connect them to (a Pro-2026 & my new BC 9000xlt).
: What would be the best way to connect both antennas to both scanners?
: I'm using RG-6 with f connectors, (the best I can afford at this time).
: Thank You for any advice!
At the least, try four A/B switches, one on each antenna/radio. One leg
each from each of two from an antenna to a radio A/B switch. Try it on
paper first, it works and its cheap!
Good luck,

3809. Re: What kind of scanner needed to recv cell

Newsgroup: rec.radio.scanner
Date: 1997-03-01 00:00:00 UTC
From: Rob McAuley <RobMc2362@msn.com>
Message-ID: <01bc2637$6e41e400$be082399@default>
Source record: 205547
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Nearly all scanners will receive cordless (not cellular) phones. Most of the base frequencies are fairly strong, and with a good antenna will be able to be picked up for about 1/4 mile or so.

CH 1 - 46.61
CH 2 - 46.63
CH 3 - 46.67
CH 4 - 46.71
CH 5 - 46.73
CH 6 - 46.77
CH 7 - 46.83
CH 8 - 46.87
CH 9 - 46.93
CH 10 - 46.97

Today's newer phones operate up in the 900 MHz bands, and can't be picked up on a regular scanner without 800+ range.

Cellular phones mostly operate in the 800+ range, and all scanners being produced today by law must not be able to normally receive these frequencies. I say normally because there are ways to modify your scanner to receive them. There are several books out there for sale which show you how to do so.

Bobby

3810. BC 855 XLT Mods?

Newsgroup: rec.radio.scanner

>

Western Europe uses 87.5 to 107.9 as an FM broadacast band. Some
countries in Europe still have some land mobile in that band.

The spectrum from 64-80? MHz is used in Eastern Bloc countries and the
former USSR. Many of these countries are in the process of converting
to 88-108.

The band 76-92MHz is the FM broadcast band in Japan.

I have always supported that TV Channels 5 & 6 be eliminated and the
band from 76 to 88MHz be used in the USA for broadcasting (including
low power radio).

```
I am looking for any frequencies for The Army Corps. of Engineers
located at John H. Kerr Dam operations.
It is also known as "Buggs Island" located on the southern VA/NC border.
It is operated by the Wilmington NC district of The Army Corp of
Engineers.
I hear 163.4375 for powerhouse and rangers. It is a repeater.
I am also looking for HF freqs. There is a HF folded dipole atop the
powerhouse mounted to a piece of 25G tower. Any help appreciated.

Vegas is one of the best places on the planet for scanning.
I suggest that when you get to Vegas that you pop down to a
local Radio Shack and get a copy of Police Call. The new
editions have both police and commercial listings for all
of the hotels/resorts/casinos.

Purchase a triple conversion scanner if you can afford it. A double conversion unit will allow too many unwanted signals from pagers etc. to disturb your railroad monitoring.

If this is your first scanner, you will soon discover that there is a whole bunch of interesting stuff to listen to out there.

Bill

You will find all US. R.R. Freq's fall between 160.00 Mhz
and 162.00 Mhz. please understand these are for operating lines
NS,CSX, Conrail ect.only. Railfan lines. RR Museums and tourest
lines may or may not use these freq,s but may also be found in
the 400 Mhz band.

Hope this helps Rick

Probably in the long term. For now things remain the same. Even if the
currently available software is "gelded", you can still "clone" your
receiver with any unblocked unit.

No. What he said was that you have no way of knowing if he is responding
to a complaint about you or not. Further, if he is and you ignore him,
well.... just try it - you'll find out first hand. :)

Although if you are in a public parking lot and not doing anything
illegal, I doubt he will haul you in for loitering - he'll just tell you
to move on. Been there, done that, never got the cute set of matching
bracelets yet...

:)

I have a small 'RIB replacement' myself. It works on *most* of the
radios, but not all. In fact the one I have is of the DB-25 jumper box
type and it won't do SYNTORs at all. I have to use the original Motorola
RIB.

Joe M.

P.S. The 286 should not be a problem for that programmer.

3849. FCC License Data Sources

FCC License Data Sources
Bill McFadden
bill.mcfadden@tek.com

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-government license in the United States (over three million records). Most of the sources listed contain a subset of this data, although a few contain all or nearly all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

Also available are subscrition services from companies like ISI and CET. Since they charge by the minute, they are not really practical for the hobbyist and hence are not included in this list.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $104, and the mapping version is $174.

Floppies are available by state for $44 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155 (voice) or http://www.grove.net/ (WWW).

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. Regional CDs cover subsets of the US but come with a more powerful database manager and provide more detail about each license. Also available is a Ham callsign and repeater database CD.

Spectrum costs $37, and the Ham and Repeater Database is $22. Regional CDs are $137 for the first CD, $102 each additional CD ($560 for the entire 6 CD set). Data is updated twice a year. PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), support@perconcorp.com (email), or http://www.perconcorp.com (WWW). The Spectrum database can be searched free of charge via Percon's WWW page.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master. Police Call has been recently renamed Beyond Police Call and now includes a limited selection of business listings.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $13 per volume.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. Standard and deluxe reports are available. Both reports include a color plot with transmitter sites marked. The deluxe report adds a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area.

To create the report, Bob requires the latitude and longitude (or nearest
| street intersection) of the center location. Standard reports are
| $29.95, and deluxe reports are $34.95. Write to Bob Parnass at 2350
| Douglas Rd, Oswego, IL, 60543, or call him at 630-554-3839 between 6-10
PM central time.

SCANWARE ASSOCIATES

ScanWare Associates makes a PC-based database program called the FCC
Frequency Retrieval System. FCC data for several states is available,
covering all services and all frequencies. More states are being added.
Current data is for first quarter, 1996.

News flash--this software and data is now FREE! However, the data will
no longer be updated, so get it while it's hot. ScanWare Associates can
be reached at 360-698-1383 (voice), 360-698-8207 (fax), gmcavoy@oz.net
| (e-mail), and http://www.oz.net/~gmcavoy/Index.html (WWW).

US SCANNER PUBLICATIONS

Similar in style to Police Call, this series of directories covers ALL
radio services between 30 MHz and 2 GHz. Each volume covers one state
and costs between $14 and $29, depending on the state. The volume for
California is 820 pages. Contact US Scanner publications at 800-890-6999
(voice) or 503-233-5176 (fax).

APPENDIX

Here is table of data fields in the FCC master. Fields provided by
various products are indicated by "#" or the field length, if known.

This comes from Norm Schrein(Mr.Scanner) he of course is in daily contact with
FT. Worth so I am going by what HE says,I feel he should be the ONE that know
as he represents UNIDEN BEARCAT.

Of course I hope he is wrong and we do indeed see them this month,BUT...

InfoTech M-200 decoder; plugs into headphone jack and will decode morse code. requires video monitor(screen) for display(not incl.)
Will also decode ASCII messaging used by some departments and businesses for data. Also radioteletype(ham bands on 144 and 430 Mhz).
Opens up whole new world to scanning.
$150 + ups from New York State

At what frequency can cell images be heard on the Pro 60. This is just out of curiousity since we never eavesdrop on cell phones.

:
:"YOUR CELLULAR PRIVACY IS _OUR_ CONCERN.
:
: ALLTEL Mobile and the CTIA (Cellular Telephone Industry Association) are
:totally commited to ensuring complete privacy for all cellular phone users.
:Together we are doing everything in our power to minimize the risk of
:eavesdropping on cellular telephone transmissions, and to toughen existing
:laws governing this offense. Intercepting cellular phone conversations is
:currently a violation of Federal and state law and we believe that anyone
:guilty of this crime should be prosecuted to the fullest extent of the law.
: To aid us in making this crime less likely, and the punishment more
:severe, we urge all cellular phone users to write their congressional
:representative and express concerns about this important issue."
:
: I'd like everyone to note the words "totally committed to ensuring
:complete privacy" and "we are doing everything in our power to minimize the
:risk of eavesdropping".
:
: As I see it, there is only ONE WAY to make good on this apparent "promise"
:to their customers...to make all scanning illegal period, and to remove all
:scanners from public hands. UNLESS, of course, they're planning on
:recalling all analog cellulars and replacing them with digitals at no cost
:to the customer. Plausible? ....NAHHHH!
:
: Should we be worried right now what these guys are really going to be up
:to next very soon in Congress? What exactly do they plan to do to make
:good on their promise? How do they expect to make good on their promise? by
:written means? or by stomping out scanner "competition" altogether?

No. They will simply deceive their customers.
Why don't they face up to the fact that no amount of laws will ensure
that an analog cell phone users call is private?

If you notice this guy has a typical cops know all and the public are all "assholes" attitude that is quite prevalent among NJ cops. Why is he defending his female whatever is puttering along a 45 MPH in the left lane forcing faster drivers to have to attempt high speed evasive maneuvers to get around his female whatever?

The militaristic training the cops in NJ get is shining right through in this guys reply!

He is correct the easiest and least expensive way to avoid speeding tickets is to slow down, but many places, especially the state of NJ use the traffic laws as revenue enhancement for the state and insurance companies, the insurers get nifty surcharges based on violation points.

It is also quite evident based on the tone of this reply the level of non respect this and many police officers in NJ carry for the population of the state that they are sworn to serve. This is a breeding ground for corruption and abuses of rights that unfortunately happens quite often in NJ.

To answer your question about radar detectors, yes cops use radar, yes a detector might help you avoid some tickets but keep in mind that the cops have become better at foiling radar detectors with newer tactics so you cannot speed with impunity because you have a detector. Yes as our cop friend has said if a cop spots a detector you WILL get a ticket because the detector shows that you intended to drive fast and your speeding was not an error in judgment.

Source record: 205622

Looking for a little humor in daily life, some people appear to monitor McDonalds drive thru window communications. Some even like to make use of what they hear to startle the "sales droids" into realizing that someone is listening to their personal comments.

If you enjoy the "I like her quarter pounders" comments, why would you let them know that someone is listening? If you engage in this type of revelation, they will realize that someone is listening, and tone down the very conversations that you seek to listen to.

Maybe "Uhhh, you want fries with dat burger" is of more interest than discussion about some girl's quarter pounders ?.

Shouldn't we keep our mouths shut?

Too bad they didn't get all four. Would have saved the taxpayers millions of dollars that will now be spent on trials, defense lawyers, and endless appeals in the joke of a criminal justice system we have in this country.

Does anyone know what frequenices Speedway Motorsports AKA Texas Motor Speedway has licensed for Fort Worth, TX in Tarrant and/or Denton counties? Perhaps someone with the latest FCC CD-ROM could post them here.

I'm looking for any frequencies that would be fun to scan at or around the new race track. Does someone have the NASCAR team frequencies on the web?

Thanks,
Ben Saladino

This will not work on all Pro-51's, I believe only on those before 11/94 (Datecode 11A4)

Hold down 2,9 & Lockout all three at the same time and then turn the scanner on. This will erase any frequencies programmed into the scanner. This loads freq's in channels 1-25 23 is the one you want. Use scan up and scan down to scan the frequencies.

I have an AOR AR-2500 Wide Band Receiver ready to ship:

- Covers from 500kHz to 1500MHz, no gaps, no blocks (receives cellular)
- Four modes: AM, Narrow FM, Wide FM, and SSB
- 3 steps: 5 (narrower filter) / 12.5 / 25Khz (wider filter)
- 2016 memory channels - 62 scan banks and 16 search banks
- RS-232C computer interface (female DB9)
- Small print, lightweight - only 5.75"W x 2.25"H x 7.0"D

Non-smoker, clean environment. Radio is in very good condition. Never any problems. Hasn't been used much at all. That's why I'm selling it. Also have box and user's manual.

Price: $350 including COD shipping (in continental U.S. only)

sure, you can monitor cellular phones by monitoring 824-851
(phones/Mobiles)
or 869-896 (towers/bases)
you may also be able to monitor these on a UHF tv or on a scanner that
gets "images" of the cellular calls elsewhere..ie + or - the IF frequency
or a multiple of the IF..consult the owners manual specifications for the
IF of your scanner!

To add another 50 channels open up the scanner and find a diode marked D201. find 5 strands of wires (jumpers)1,2,3,4,5 (left to right) cut #4and solder a 10k ohm resistor to the bottom of the cut jumper and to the bottom of D201. you now have 100 channels instead of 50. Do the same thing to #5 jumper and solder a 10k ohm resistor to the bottom lead and to D201 and you have full 800mhz coverage. sounds hard but when you open the scanner you will see how easy it really is.

> You never did answer my question: why are you so anti-christian
> and not other religions of the world? Your theme seems to be anti-
> religion yet you only speak to one, without particulars of any sort.
> Is it personal madness, hate?

Why am I not anti-buddhist? Well, because buddhists are not
evil. Buddhists don't want to destroy and conquer nature, but to live
in harmony with nature. Xian's on the otherhand feel it is their
manifest destiny to plunder the earth, spread their doctrine worldwide,
destroy civilizations built upon ancient religions and force them to
adopt xianity. FYI, Buddha is an Antichrist, Buddhism is antichristian.

Reference: http://www.antichrist.com/buddha.htm

Have you ever seen the natural state of the south american
indians? Perhaps films shot 30 years ago will depict this. Today, these
same people, who now worship jeziz, wear taiwan made T-shirts, donated
by the xians, and to me, they look like a southern USA trailer park
clan! THIS IS NOT RIGHT! Xians are EVIL, and are destroying the world
in the name of jeziz!

When the xians first visited the jungle people in south america,
they were eaten by them. Later, they brought guns and FORCED their
doctrine upon the natives. Their so-called "god" tells them that this
is the way, that this is right, however, I have no god, and to me, this
IS WRONG! To me, xianity is evil because it forces ONE belief system.

I hope you can understand why I am so antichristian, why I am
in support of organizations who wish to promote antichristian thought,
and to ultimately do away with such an evil religion. There is only
one religion that is bent upon forced adoption of their belif system,
and that is christianity. I like to use the phrase "I am Jesus of Borg.
Your religions will be assimilated. Resistance is futile".....sq

3878. Scanner Antenna Review

Newsgroup: rec.radio.scanner
Date: 1997-03-02 00:00:00 UTC
From: wa2sqq@hili.com
Message-ID: <331dc8af.2024410@news.ios.com>
Source record: 205379

Scanner Antenna Review - Which is the Best?

Shortly after purchasing my AOR 8000 I found myself searching the USENET scanner related groups, seeking out tips, tricks, mods and suggestions to allow me to get the most from my new toy. It didn't take long to see that everyone had their own opinion as to the best choice for add-ons such as batteries, carrying cases and antennas. Ah, the antenna - without it the best of scanners are worthless so I decided to do some research and see what the market had to offer. Within a few days I found several types, colors and sizes - metal, rubber, colored, flexible and firm. There were retractable, collapsible, stubby and long versions. If I didn't know better I'd say we were reading an ad for some sort of kinky sexual appliance! After a month of reading and asking questions I quickly came to the conclusion that the only way I was going to see which one was truly the best was to try each one and perform some sort of evaluation.

The Evaluation Method

While the AR-8000 provides an LCD S-meter, I've found it to be the perfect example of a "relative" signal strength. I decided to use the meter on my Icom R7100, mounting each of the selected antennas directly to the receiver using a right angle N to BNC adapter. Using the AR-8000's antenna as the baseline for comparison, each antenna was checked on several frequencies within each frequency range. The numbers represented indicate the number of "S" units each antenna delivered AS COMPARED TO THE STOCK AR-8000 ANTENNA. Hence "2" indicated that the particular antenna performed 2 "S" units better than the stock 8000 antenna. A value of 0 indicates the performance at that frequency was equal to the stock AR-8000 rubber duckie, while a negative number (-1) indicates the AR-8000 was better by that amount.

So as to arrange the data in a format that can be easily compared, the antennas presented from left to right are as follows, while the vertical column represents the frequencies at which each antenna was tested.

1. Radio Shack collapsible whip with loading coil.
2. Comet SH-55
3. Diamond RH-77CA "New Improved Version"
4. Maldol FR-30
5. Icom Dual Band 2m / 440
6. Yaesu Dual Band 2m / 440
7. Radio Shack PRO-43 Stock Antenna - Touted as " best all around antenna"
8. Miracle Baby

152.54 AR8K, Comet SH-55, Icom Dual Band
162.55 Diamond RH-77CA
224.06 AR-8K, Radio Shack, Comet SH-55, Diamond RH77
412.625 AR-8K, RH-77, Icom, Yaesu
452.100 Comet SH-55
470.8375 Maldol FR-30
856.9625 Icom, Yaesu Dual Band
890.000 Miracle Baby
929.225 Radio Shack collapsible whip with loading coil

Comments and Observations

1. Several antennas including the Comet, Diamond, Yaesu and Icom were originally designed as enhanced transmitting antennas for the two meter and 70 cm amateur bands. I check the transmit performance against the dual band rubber duckie that came with my Yaesu FT-51 and was very surprised with the results. While the received signal

strength did vary a bit, there was NO noticeable difference in the transmitted signal. Effectively, all these antennas are something resembling a quarter wave at their respective amateur frequencies. Antennas such as the Comet and the Diamond will help you hear the signals, but don't expect the station at the other end to hear any difference!

2. I created a simple counterpoise that consisted of a 15-19" piece of wire, with a paper clip soldered to one end. The clip was bent so as to allow it to clip around the ground portion of the BNC connector of the antennas tested. Depending on the frequency, this simple addition of a counterpoise increased the signal by as much as 2.5 S units, particularly when the radio was sitting on the table. This signal gain WAS seen in transmit as well as receive. The effect of this counterpoise is lessened when the radio is hand as our body acts in the same way as the wire. I strongly recommend this simple addition if your scanner is worn "belt side."

3. As with most receiving antennas, longer is usually better. This is attributed to a larger capture area. My own conclusions, based on the fact that I live in a very high RF congested area near New York City is that the standard AR-8000 antenna is probably the best all around antenna. Adding the "free" counterpoise when the radio is worn "beltside" raises the performance to equal most of the antennas tested. And while some antennas might show a definite peak at certain frequencies, most scanners are prone to intermod in high RF environments, thus causing the gain of the antenna to degrade receiver performance rather than enhance it.

I'd like to hear your comments and I'd like to pass along my thanks to those who e mailed me with their favorite picks. A special thanks to Marv, WA2BFW and Steve, WI2W who loaned me several of the antennas that I tested.

3879. Speech Inverter Kit! $39

I've seen many messages scroll by asking about Speech
Inversion/Descrambler methods and Kits... Heres' your answer!

SPEECH SCRAMBLER/DESCRAMBLER KIT

It Encodes AND Decodes at the same time (full duplex). The Unit is
able to drive a speaker directly and is rated at a full 2 watts audio
output! RCA Input and Output jacks provided. The unit requires
9~12VDC. This unit is a Kit. It requires assembly and basic hand
tools.

Kit cost: $39.95, Case cost: $14.95

I expect one can put this kit together in about one hour or less...
perhaps a little longer for a novice. Because there are IC's used in
this kit, I would highly recommend a very small solder iron (about 15
watts) with a fine tip!

I don't know if you have ever just listened to the control channel and nothing else, but you don't get much if any interference. To get interference the radio frequency must be inactive.

It will be dual conversion.

happy scanning

tom

Jon Van Allen wrote:

> No it doesn't

Seconded.

I just spent a week with a set of calibrated EMC antennas, 5 ants at $2k each, and an HP EMC analyzer. This was running side-by-side with an Icom IC-R8500 and radio shack Discone.

We will use the icom under computer control with the discone as a low-cost EMC pre-scan setup, based on the results of the side-to-side testing.

The discone's gain falls off at the outer edges of the band, as expected, and it dosen't have a lot of gain. It is, however, fairly flat from about 100mhz - 1Ghz. Below 100 it begins to get passband ripple of 1-2 DB at 100 -- 6-8 db at 30. Below 30 the gain falls off very rapidly.

Mechanical construction is fine, and you should use Loc-tite on the elements for permanent installation.

It was never intended as a high gain antenna, that would be silly. what it IS, is a very broadband antenna. I suspect that those getting poor results with it are actually getting front-end overload.

Coax makes a big difference too, Frankly the RS brands bite. I used RG-214 with N connectors on each end, and a PL-259 to N adaptor at the antenna. The coax losses were calibrated out of the setup with the EMC analyzer. (reads gain at freq in cal mode and compensates the display for that particular cable).

The RS discone makes a great portable antenna for emergency work, as it will work with just about ANY HT, and can be folded up into a very small package for transport. For scanning it's fine, but you need to pay attention to what's going on. You asked the antenna to deliver EVERYTHING to you, and that's what it's doing. Try a 10db attenuator.

> Thanks,Dennis

Good question? what is the stuff made of? Spray some on a piece of cardboard. Let it dry. Place it in the microwave oven. Also place a cup of cold water in the oven. Heat for 30 or 40 seconds on high power. If the cardboard get warm or even worse catches fire I'd think twice about useing it (Its rf conductive). I know this sounds like a cooking class but it works well. If you build antennas with PVC you should do the same thing with a chunk of the PVC cuz all PVC isnt rf clear.

Good luck

Wrong. It is up to the airline. And some airlines do permit their
use above 10,000 feet - Delta and Reno, for example.

3894. Pro-51 problems

Newsgroup: rec.radio.scanner
Date: 1997-03-02 00:00:00 UTC
From: emah@direct.ca
Message-ID: <5fcvd3$e1h$1@aphex.direct.ca>
Source record: 205395

Is there anyone that can help me with a problem with my Pro-51? Whenever I connect or disconnect the cigarette adapter plug at the scanner, I lose some or all of my programmed frequencies. Sometimes I even get frequencies that I didn't program in. These symptoms only appear if the unit is left turned on and the rechargeable batteries are still installed. It doesn't make any difference whether I'm plugging/unplugging at the power port or the charge port. The date code is 5A5.

I took the scanner into Intertan for repair back in Nov. and all they did was replace the power port jack. Took them a month to get the part in. Didn't make any difference. This time they tell me it is the 'eprom' chip that is acting up. That part has been on backorder for over two months now. Great warranty Radio Shack!

Any ideas or suggestions would be greatly appreciated.

Ed

Good evening

I'm looking for a handheld scanner with the following specs:
-minimum of 100 channels
-CTCSS Pl tone included in the unit
If you have suxh a unit for sale and are located driving distance of Ottawa Canada please e-mail me with thw model and a description of your unit.

Thank you

Same here. In my book, the BC3000 wins hands down.
400 channels vs. 200 channels alone is worth the
difference.

I saw the head shot on the ABC Network News also..., but not on the
local news. It was pretty cool though.

This does involve a scanner...

Ottawa, Canada:

Friday February 28, 1997...

It seems that a local loan company was held up in an armed robbery. The thieves made off with an undislosed amount of cash, one of the thieves left his police scanner behind. Realizing his error, he went back to retrieve it a while later. Finding the loan company doors locked, which is normal after an armed robbery, the moron smashed his way through the two plate glass doors. He then screamed give me back my scanner! At which time he got to meet several of Ottawa's finest who were on scene. This rocket scientist surrendered without a further incident.

I guess he valued his scanner more than the robbery take.

In Arlington Texas using a BC760XLT there is a heck of a carrier
present on one of Arlington City's trunking system channels.
It's always there, has a slight 60 Hz buzz and it is about as
strong as the trunked system.

This is on one of the trunking channels in the rotation for service
as a trunking data channel. The BC760XLT is dual conversion.

Jim

> one type of system. Thanks for reading this.

There is some work ongoing in this field. Some of this product
would take the form of an accessory that can be added to an existing
scanner and doesn't require tieing up a $1500 Pentium to do it
so the PC can be used for something more useful like display the
trunked data and surfing the net!

More details as they become available - and I'm sure others will
make input here as well.

Jim

> Thank You for any advice!

I would suggest you try a "T" type union. Available in many places.

The impedance of the 860MHz antenna will be VERY high outside of the
860MHz
band and therefore should not have any adverse affect on the all-bander.

Check on 800MHz frequencies to see if there is any bad interaction
between
the two.

Cheers!

Reminds me of a story here in the Chicago area from a few years ago. It doesn't involve a scanner, but it is funny:

A scumbag S.O.B. breaks his way into a liquor store late at night after it's closed. Not hearing any alarms or other activity, he figures he's got the run of the place so he raids the till then hangs around and helps himself to the booze. The owner arrives the next day and finds the guy passed out and stinking drunk (undoubtedly with one hellofa hangover), with a bottle of something or another in one hand, and a bag of money in the other. According to the news story, he didn't even bother to steal the good stuff.

He surrendered to Chicago's Finest without a fight.

When I was on Bonaire, I found most local users up on one or two
800MHz trunked systems.

But of course you'll also want to monitor the VHF marine band, and the
450/460MHz systems that the cruise ships use for their crews.

If I recall right, Aruba has casinos -- they and the hotels should
have a lot of interesting comms, as they try to put up with the stupid
drunk touristas! ;)

11178kHz USB is used by the military there, for their small patrol
vessels & aircraft.

Sorry, Steve! You are missing a few ...like anti-buddists, anti-
islam, anti-shintoists, anti-moslems etc, etc.

You never did answer my question: why are you so anti-christian
and not other religions of the world? Your theme seems to be anti-
religion yet you only speak to one, without particulars of any sort.
Is it personal madness, hate?

When I was in Vegas last, I took the scanner, WOW! I could not belive what I could pick up, Everything!!! The place is just buzzzzing with radio activity. I had a hard time turning the scanner off to go to bed.

The UHF band was the best, just set your scanner to search, it will stop on allmost every frequency there is. You will hear it all, I remember them talking about this guy at a black jack table cheating somehow, they were on him like a pack of wolves! he never got out alive.

WARNING: Security is everywhere in Vegas, DON'T TAKE THE SCANNER INTO A CASINO, They will think your up to no good.

I am going to be in the Pensacola area in the next couple of weeks. I know from past visits that there is a lot of military air traffic in the area. Does anyone have frequencys for Pensacola NAS and/or Eglin AFB? I have Radio Shack's "Police Call" for the SE and have put in what appear to be useful frequencys for the area, but I would appreciate hearing from anyone who has confirmed frequencys for those military installations. Thanks.

If you're looking for maximum mobile reception on "46 and 49Mhz", try a quarter-wave ham antenna cut for 6 meters. Cost: about $25 for a good magnet-mount version.

>I have read the law and all of the most recent posts and still cannot
>answer the question: Is it against the law for me to order a scanner
(say,
>from Canada) that happens to be cellular capable?

...the land of the free and the home of the timid?

boy, is it Twilight Zone or what?

the being in fear over a product that hears information which
may get one arrested.

People...there is a dichotomy in play here.

First we have the Freedom of Information Act. That implies that
information is the right to be known by all who are legal citizens
in the USA. Second, we have this new view that reading infor-
mation is ok. As long as you sign on the dotted line to get it
from the vaults where it is kept...a non-segitur.

Now we have a new attitude being introduced into the American
mainstream by a small minority of elected degenerates that we
are not entitled to listen to all this information coming out
of radios which catch officials talking and authorities breaking
the law when they order their troops to "do it myway"....

we have a new vision being outlined for USa. That of "hear no
evil". But if you do, you will be sent to jail for your being
able to hear what we say.

then who is behind this: MONEY. big Money.

Just so they can tell buyers that others who listen in on their
cellular phone conversations will go to jail when caught...and
they will be caught.

But we know that the Cellular Companies have the technology to
put into the cell phones that will prevent scanner-listeners to
listen.

GET it. There is this dichotomy at play here. They have and yet
they want us to go to jail for what they refuse to fix.

Ain't it wunnerful being an American today? Going to jail or
losing face or losing the scanner or losing money because they

who make the item are in control of your freedom.

Seems the Cellular Industry and RED CHINA are reading from the same book on how to keep people silent and in check.

Seems our elected officials are in bed with the people who would enslave us. when we cannot get information we are as good as "captured" in a vacuum constructed so a large corporation owned in part by foreign countries can dictate to us our freedoms.

Tell us what is wrong here.

Just think: next thing that gets you in jail will be a guy having phone-sex on his cell phone. You cannot listen, but the people took away that right can.

bill conduit
etc.

i want to connect two antennas (all-band ground plane and 860mhz yagi)to two scanners (a pro-2026 and a bc9000xlt).i'm using RG-6 cable and f connectors. Can i use a 4-way splitter(using the 4 outputs) the way they come or would it work if i open it up and replaced the caps and inds by soldering jumpers of RG-6 between the center conductors.
THANK YOU FOR ANY HELP!

> Reception is good here in the mountains. I want to add a "Y" > > connector somewhere (at the antenna might be a problem due to the
> Apex assembly)

This is one of those situations where you can "get away with it" if all the antenna does is receive. Life gets more complicated if you want to transmit with a "Y" setup. I'd use a coax T-connector inside the house rather than splitting it outside. This should avoid water proofing problems more than anything else. It really does not matter where you split the transmission line. If you had all the right test gear you would "see" a difference. If you're just going by ear to determine signal strength, like I said before, you could get away with it. I had a scanner once that was sensitive to a Y-connector (or, T-connector) running off of the broadcast antenna on my car. Other scanners did not seem to mind as much. So, your mileage may vary,

JoAnne

On 1997/02/28, in message <3316D941.15FB@vnet.ibm.com>,
Rich Wells <rjwells@vnet.ibm.com> wrote:

```
-----------------------------------------------------------------------
| Lorin,
| The UHF military air band(225-400MHz) is only covered in higher-end
| (read most $) radios. Radio Shack has the Pro-60 on sale for $200 which
| is a great deal and this radio covers this band, as well as many other!
| Probably your best bet for getting a quality, new receiver at a good
| value price.
=======================================================================
```

based on which I say:

I "took the plunge" and bought the PRO-60 last night. My first impression was that it was too hard to program, since I was used to the Uniden stuff. After about 2 minutes of tinkering, I was programming stuff like crazy! It's actually not hard at all. :)

Downsides to it that I've noticed:

1) The light on the display is terrible. It barely does anything. :(
2) The display is harder to read that some units, like my SportCat 150.
3) The scanning speed doesn't seem to be as fast as that of my SportCat.
4) 6 batteries? Boy, that adds some weight! :)

These are all minor things. I still can't believe that I got it for $200 when it retails at $379!

Note on Rat Shack sales droid:

The guy who sold me the scanner seemed to know what he was talking about, and he wasn't even a manager! He actually seemed to know about scanners and scanning. Granted, I had to drive a bit out of my way to get to this store, but I think it was worth it. :)

Barry,

I see from your address that you are in the land 'down unda.' You may not know that in the USA it IS illegal to monitor cordless phones. This was a recent addition to the ECPA which is the law concerning cellular phone monitoring. Since C. Daniel is appearantly in the USA, he must comply with U.S. laws. (again look at his address - government address yet!) Thus, it is not more or less legal to monitor cordless as cellular. It just happens to be easier on most of the new scanners since those ranges are not blocked. However, this MAY not apply to him if he unplugs the base unit on HIS cordless phone and listens to others on the same channel! This is not a legal opinion so don't take it as such.

> I'm thinking of getting one anyone have any experience with it?

If you are talking about the Xplorer from Optoelectronics, they are having a severe problem with them. If you are sitting next to someone within about 20 feet when they key up on a 100W radio, POP goes your front end amplifier. Opto says they will usually replace it once, but after that it's about $60.00 per 'pop.' So, if you get one, don't use it anywhere in traffic. The van behind you may just key up on his radio and reduce your Xplorer to a $900.00 paperweight!

Best part is: they won;t fix the problem. My scanner has been within a few feet of a UHF antenna and not suffered any ill effects, but Opto says it is too expensive to incorporate that kind of front end into the Xplorer. How this can se so inexpensive on a $89.00 scanner that has 0.2 microvolts of sensitivity and so expensive on the Xplorer that costs $900.00 and has a copule HUNDRED microvolt sensitivity?

I would suggest NOT getting one until they fix this built-in flaw.

Anyone else see this problem? If not, be careful! It only takes a fraction of a second - literally!

Was there an answer to Steve's question in this speech? I think I recall
that it is illegal to import a scanner into the US that does not meet
the criteria that those already available here do. Now the 'importer'
can be considered either the company you bought it from or some will say
YOU were the importer.

> Thanks,Dennis

You should be OK. Just make sure the paint doesn't have any metallic content. If it does, it may reduce the received signal strength. I've done this with my mobile antennas and find that I have to re-coat them about twice a year since the wind takes the paint off. The same can be said for stationary antennas, but it may take longer for the paint to wear off. Even the commercial fiberglass antenna's resin coating comes off in time. It's funny how powerful the elements are.

3978. Re: Update on Trunktracker

Newsgroup: rec.radio.scanner
Date: 1997-03-02 00:00:00 UTC
From: Thomas Gasta <tomgasta@worldnet.att.net>
Message-ID: <5faqrq$rkp@mtinsc03.worldnet.att.net>
Source record: 205560

I talked to someone at Uniden Friday and asked that very question. The answer was, wellll, we kinda think by the next few weeks it will be approved. However, the literature they put out still says no, and that it wont be sold or leased until it is. So, it is probably worth the wait, while holding your money, until it actually is in several dealers hand.

You never know what Moto may be up to!

Tom

3979. Re: Do cops really use radar?

3984. [Q] Identification in business radio service

Newsgroup: rec.radio.scanner
Date: 1997-03-02 00:00:00 UTC
From: Miquel DePablo <Miquel.DePablo@lawrence.edu>
Message-ID: <01bc26c6$85ab2fe0$23642c8f@pkt-mu.lawrence.edu>
Source record: 205566

Greetings everyone,

My school (Lawrence University, Appleton, WI) uses a repeater system with one base station and a bunch of portables. Their frequencies are 469.925 (repeater input) and 464.925 (repeater output). I have never heard a CW ID, or any other sort of ID for that matter. Should the repeater ID its callsign periodically? (in other words, are they operating illegally?).

TIA,

- Miquel, N9SMS

Does anybody know if it is possible to recieve cellular phone freqs on my RS PRO-2037? Any help would be greatly appreciated.

3987. Re: What is the law on cell and cordless phone listening

Newsgroup: rec.radio.scanner
Date: 1997-03-02 00:00:00 UTC
From: dstark@frontiernet.net
Message-ID: <5fb5cm$18lo@node2.frontiernet.net>
Source record: 205569

Yet another uninformed newbie jumps into an ancient thread.

First off, newbie, you are in Australia and the person at nasa.gov is
in the USA. It may be legal for Aussies to monitor cordless phones,
but not for Americans.

Second, the thread you answered is already dead, and it contains many
correct responses as to the state of the law in the country where the
thread originated. Please check the dates on articles before posting
a useless response.

The most common frequency pairs to check are:

30.8400 --- 154.5700
31.0000 --- 170.3050
33.1600 --- 154.5150
33.4000 --- 154.5400
35.0200 --- 154.6000
457.5375 --- 468.3875
457.5500 --- 467.7750
457.6000 --- 467.8250
461.0375 --- 466.0375
460.8875 --- 465.8875
461.0875 --- 466.0875
469.0125 --- 464.0125

These are all the frequencies that you should search if you
can't can get a hit on the common pairs:

FREQUENCIES TO CHECK FOR FAST FOOD RESTAURANTS

VHF-low:

30.7600 30.8000 30.8400 30.8800 30.9200 30.9600 31.0000 31.0400 31.1600
31.2000 31.2400 33.1400 33.1600 33.4000 35.0200 35.0400 35.0600 35.0800
35.1000 35.1200 35.1400 35.1800 35.7000 35.7200 35.8800 35.9000 35.9200
35.9400 35.9600 35.9800 42.9600 42.9800 43.0000

Bob

3989. San Francisco Hilton Frequencies?

Newsgroup: rec.radio.scanner
Date: 1997-03-02 00:00:00 UTC
From: "Robert H. Eisner" <rheisner@worldnet.att.net>
Message-ID: <33191FC4.2087@worldnet.att.net>
Source record: 205571
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Does anyone have frequencies for the San Francisco Hilton?

Thanks,
Bob

3990. Importing scanner illegal

Newsgroup: rec.radio.scanner
Date: 1997-03-02 00:00:00 UTC
From: Steve Dallas Johnson <sdj1@earthlink.net>
Message-ID: <01bc26d0$c096e9a0$fca42499@ELN/sdj1>
Source record: 205572

I have read the law and all of the most recent posts and still cannot answer the question: Is it against the law for me to order a scanner (say, from Canada) that happens to be cellular capable? If so, then why would do the Canadian vendors seem to have no problem with it (at least on their web sites)?

Has anyone heard of anyone having any problem receiving a scanner by mail that they purchased out of the U.S.?

Thanks.

Steve

3991. Pro26 vs 3000xlt?

Newsgroup: rec.radio.scanner
Date: 1997-03-02 00:00:00 UTC
From: Chris <chrism@bga.com>
Message-ID: <331920D8.44BB@bga.com>

Hi everyone,

I am seeking to gain the concensus regarding the following: which of the two handhleds has the better performance/following, the RS PRO 26 or the Uniden UBC (BC?)3000xlt?
The criteria includes sensitivity, reliability, ease of use, and any other areas that you feel is relevant.
Thanks in advance to all those taking the time to send/post sensible replies.

Chris in Austin TX

Well here are a few more for you. I didn't know about WOR's frequency and I
believe the WFAN frequency is wrong. WFAS-FM uses the frequency 450.650:

452.9750 Shadow Traffic F-1, Operations (PL 103.5hz), input 457.9750
450.8375 Shadow Traffic F-2, Westchester (PL 103.5hz), input 455.8375
453.0000 Shadow Traffic F-3, New Jersey (PL 103.5hz), input 458.0000
(Anybody know the F-4 frequency and what is it for?)
455.5625 Shadow Traffic F-5, Production (PL 103.5hz), simplex
Also WINS-AM
450.1375 Shadow Traffic F-6, Connecticut (PL 103.5hz), input 455.1375
450.8125 Metro Traffic, Production (PL 67.0hz), input 455.8125
450.0875 WCBS-AM, Production (PL 94.8hz), input 455.7000
This is also known as Shadow Traffic F-8 and is used by AIR-9
(a Shadow Traffic reporter) for Suburban Sky Patrol reports.
450.5626 WALK-FM, Production, simplex

450.6500 WFAS-FM, Production, simplex

>it one time during freeband mod?

I played with mine a bit and I think you have to reset the CPU to get
back to that menu of settings. If I remember correctly, it's the
power on with lamp & knob pressed, then press F/W. Actually, I think
you need to power it on twice in a row like this to get it to reset.
I think the first time is turning on the wide receive (if it was off).

I tried a couple of the other band settings, but I didn't bother to
try to figure out exactly what they covered. There appear to be settings
for the bottom and top end of the signal strength meter as well as the
settings for the transmit power levels. I didn't muck around with them
yet, but I don't think you can do much harm here as long as you write
down the original setting and don't go past the high power setting
(or at least not too far past it).

>Is there a power on button sequence that will reset the microprocessor
>without clearing memories?

I don't think so.

>What are all the different power-on-button-sequences and what do each of
>them do?

There's the knob & lamp that I think does extended Rx and/or CPU reset.
MR/skip goes into the game mode. Lamp, PTT & knob goes into the big
factory settings menu. Lamp goes into the display test mode. Lamp
and PTT goes into the memory-only/commercial radio mode.

>Is there a mod for receive in the 25-75 MHz range ?
>Is there a mod for TX (or RX) in the 220+ MHz band ?
>Is there a mod for TX in the 800/900 MHz bands ?

I don't think so and I would be surprised to see one that didn't
involve massive changes, especially for 800-900 transmit.

>What happens when you turn off the CPU clock shift function ?
>What would this be used for, scanning via some sort of computer like
>computer aided scanning ?

I don't know. If I'm not mistaken, I changed mine and couldn't notice
any functional difference in the minute or so that I played with it.

Message-ID: <01bc2791$adc45e40$329961cc@default>
Source record: 205231

Sure it is. The easiest way is to spray the interior of the scanner with a coating of metallic shielding paint. Try contacting some electronics stores in your area for price and availability of this paint. The other way is to buy self adhesive copper foil tape and cover the interior of the scanner with it. Either way works but make sure you don't accidently ground out components with either method. good luck.

>scanners available?? How does one get started??
>
>

First of all get yourself a copy of the original MDTSTUFF posting, or one of the various Pocsag pager documents. Build or buy the circuit described therein. There are some refinements possible, but the basic circuit should do it all.

Find the NFM discriminator output inside your scanner. Bill Cheeks discriminator list can help here. Attach the first capacitor and resistor to this point, and this to some kind of connector (eg 1/8" mono- jack).

Attach an audio cable about 6 feet long, to the remainder of the circuit at the far end of the cable. The computer end of the cable is a DB9 or DB25 connector. I put all the components remaining (2 caps, 4 diodes, opamp and resistors) inside a DB25 hood (cover). This is a very tight fit. You may want to put it inside a small plastic case.

Connect up you cable and set your scanner to a known MDT frequency. I suggest an Ardis Freq, say 855.8375. In DOS, run the MDT program. If all you get is
00 00 00 00 00 00 0 0 percent full mesages, rerun it with any parm which turns on reverse polarity checking.

Watch the data flow.....

Now go find some more frequencies.

If you have trouble with your interface, get it to work with the PD203 pager program first.

Good luck,
Howard Higgins

4001. speech inverter homebuilt w/problems

Newsgroup: rec.radio.scanner
Date: 1997-03-03 00:00:00 UTC
From: tyler@cyberia.com
Message-ID: <5fes0c$311$1@news3.microserve.net>

I'm building a speech inverter from an old Radio Electronics issue. (Jan. '88) It uses a 3.5 kilohertz inversion point and uses an RC osc. based around a 555 timer. BUT, I wired up the oscillator and a freq counter and the thing bounces around all over the place! It's going from 3.4 khz to 3.6 khz!! That's not going to help the speech inversion very much. I don't know how stable the counter is, but I don't know how stable the RC 555 osc is either. Does anybody know a better way??? Thanks for any help.

:The comment that this is a good SECOND scanner is right on the money.
:It is not as easy to operate as, for example, a Radio Shack/Bearcat
:scanner, but it's size makes up for that.

I'd like to back up that statement. Extended frequency coverage and
nice features are counteracted by fiddly operation, slow scan speed,
and tendancy to pick up signals where they don't belong. I found the
HF reception quite good even with the standard ducky antenna. I see
people complaining that their extended covarage scanner is useless
at MW broadcast frequencies but that does not apply to the WS-1000.

For the information of prospective buyers the WS-1000 has the following features.

Frequency range 500 Khz to 1,300 Mhz uninterupted.

Steps 1, 5, 6.25, 9, 10, 12.5, 15, 20, 25, 30, 50, 100 Khz.

4010. Charging a car battery....Question

Newsgroup: rec.radio.scanner
Date: 1997-03-03 00:00:00 UTC
From: bishwa@uwyo.edu
Message-ID: <1997Mar3.094639.26306@roper.uwyo.edu>
Source record: 205242

Hi all,
Have been using a scanner in car. Got one extra 12V battery I wanna make use of. It really reduces the engine interference and other noises. Just wondering if it is possible to charge that battery with the one installed in the car, through cigarette adapter. I am assuming if two batteries are put in parallel, both the batteries should be equally charged. Question is, does this combination put extra strain on the alternator or other component in the car?
Any response would be appreciated. Please post or reply. Thanks in advance.

Do you know of another way of getting the 10% discount? I already have the RS Credit Card so can't do that again. I do sometimes get 10% off coupons from Radio Shack but have not seen some for a while. Want to buy the Pro 60 and with the additional 10% would make if 57% off the regular price. Not a bad deal?

Does anyone have specs for the replacement for the Pro60? I think someone posted some a while back but can't find the info.

>>help in getting started with scanning?

Three sources immediately come to mind:

1. Although not GUARANTEED, your local Amateur Radio Club USUALLY has
a few scanner enthusiasts in their ranks:

CENTRAL OH SEVERE WEATHER NET N8WX
JOHN P MONTGOMERY N8PVC PRES
642 S 9TH ST
COLUMBUS, OH 43206
Tel (days): 614-223-6664
Tel (eves): 614-463-9158

CENTRAL OHIO ARES K8DDG
BILL CARPENTER AA8EY PRES
3934 MAIDSTONE DR
COLUMBUS, OH 43230
Tel (days): 614-476-2131
Tel (eves): 614-476-2131

COLUMBUS ARA W8TO
ROBERT IRWIN N8SED TREAS
1364 S WEYANT AVE
COLUMBUS, OH 43227
Tel (days): 614-228-0080
Tel (eves): 614-237-8014

2. Your local Radio Shack dealer probably has a local Frequency List for
your region.

3. Watch this NewsGroup for posts from BOB PARNASS. He regularly updates
his great, "How to Find Scanner Frequencies" article - and others - as a
public service.

If you're too anxious <grin>, let me know, and I'll EMail you a couple
of his articles.

There are a couple of ways to run and charge batteries in parallel.
One way that is inexpensive and works well is using a relay such
as a Ford style starter solenoid to energize when the key is on so
the battery will charge but is separate from the starting battery
when the key is off.

You could also use the cigarette lighter plug if the battery is
smaller like a gel cell. If you are using a regular car battery
or deep cycle RV type battery, I would not use the cig. lighter
to charge the battery because of the huge current potential.

There are also RV battery isolation chargers available, which
would be the safest method to keep the batteries separated.

I use 2 batteries in my car. You do need to be concerned about the
gauge of the wire to the 2nd battery if you intend on running the
alternator to it.

My setup is like so:

From the orig battery I have wires connected to (+) and (-), these
wires run to a cigarette receptacle. Then I have another wire with a
cigarette plug connected to the receptacle with wires running to the
2nd battery in the trunk. These two stay connected most of the time.
The plug is right next to me on the seat. I disconnect them before
starting on a cold morning or too much draw could smoke some wires! I
am using 16g wire. Been using this setup all winter with no problems.

I connect radios and whatnot to the 2nd battery. When noise is an
issue, pull the plug and the rear battery is now running solo.

I have a 110A alternator, so I'm not really concerned about burning it
up. If you have anything under 65A, I'd be careful if both batteries
are real low. Putting a full charge into 2 wet cells might cause a
problem.

This is the poor man method. If you want to do it right so you don't
have to worry about it, they sell diode packs that automatically take
care of everything you need to keep 1 battery isolated. They cost
anywhere from $40 - $150. I've seen them for sale in the JC Whitney
catalogs.

Good luck !

>like this.....

It is worth pointing out that even had Congress left everything well enough alone, this fool would also be guilty under the old "Radio Secrecy Act" (Section 602 of the Communications Act of 1934), though the courts would have had more fun proving it.

Making such a tape public had better be strongly in the public's interest, and if one is to do such a thing, one had better be *VERY* anonymous.

The unwritten rule here, scanner folks, is listen all you want. Go ahead, record what you wish. But if it ever becomes public that you heard (or worse still, recorded) something juicy, you'd better be prepared for criminal prosecution.

The public is scared of scanner users. They don't understand radio they way they once did. They're scared of computer and/or electronic terrorists. When that happens, the public doesn't care what the reasons are --they start legislating the hobby's legitimacy away. It has happend to hunters, it has happened to private pilots, it is happening to ham radio, it will happen to the internet.

The public needs the folks who understand this stuff, but they aren't willing to give them a place to learn. Kinda like the old community airports used to be, or the ham's back yard antenna. It's time to get stupid, hide underground, and pretend that nobody's home.

Don't ask me, I just said duhhhhh...

No, the answer is more difficult than this. It's called
the electorate being schooled in the things which an elected
official is to do to maintain a society of free people who
are thereby given free reign to anything written and spoken
and heard. There is nothing less.

But as you see, those elected are in office because of their
own agendas based on the power machines that put them there in
the space they inhibit.

The first: education
the second: the voting booth

Help!

I am spending the week in Atlanta (Gwinett) and can't find the
emergency service frequencies that work. Hate to believe that I
lugged my scanner here for no reason. Can't figure out if they
are trunked or not.
If any one has some valid frequencies for this area please post them.

Thanks
Bill

4032. Pro-26: experiences and questions

Newsgroup: rec.radio.scanner
Date: 1997-03-03 00:00:00 UTC
From: ricklew@aztec.asu.edu
Message-ID: <5ffh1i$iih@news.asu.edu>
Source record: 205264

Hi, All,
I picked up a Pro-26 on sale. And while I love its design,
I'm having problems.
Seems that the front end is quite prone to overload. I live about
five miles away from a major antenna farm, and the input from that
does wreak a *bit* of havoc on my Alinco 130-174mHz handheld,
but wow! It just destroys the Pro-26!
The Mesa FD on 154.34 is nowhere near as strong as on the
2004, and I suspect that's due to
'desensing" from other frequencies.
I can't get the Phhoenix Sky Harbor ATIS on 121.2, just images
from the FM band. Using the attenuation is a thought, but that doesn't
just affect the massive antenna-farm signals, but also lowers the
ones I *want* to hear.

On the plus side (which is why I bought it, ad why I'd *love* to
make it work for me):
It gets the entire UHF TV band, *and* you can get those distant
signals in the narrow mode (just step to the 5kHz setting, and you
can do that, plus adjust for offsets; it's my understanding that
some other RS handhelds only do the 6mHz steps).
I also feel that its design, in general, is quite user-friendly.

So '''
Before I take it back to Radio Shack for a refund '''
Has anyone done well with this scanner in an urban environment?
It does quite well with the TV band, and the 162.400 in Tucson comes
in much better than on the 2004 (when the pagers don't wipe it
out), so I see this unit's potential.
is there anything I can do or try to maximize performance?
Or is this scanner only suitable for those far enough away from
heavy RF fields?
Thanks for all of your input.
(Oh, for those wondering: I've tried two antennas: the whip RS
sells, and a half-wave 2-meter whip; I've yet to use the
rubber antenna supplied, but can't picture its results differing
much).

Yup. It's a U.S. thing. When our Federal Communications Commission went to parcel out spectrum for analog cellular (aka AMPS), they decided there would be two licenses granted in each region: one to the local telephone company, the wireline carrier, who was assigned the B frequencies; and one to somebody else, the non-wireline carrier, who was assigned the A frequencies. Channels 1-666 were part of the original allocation. 1-333 belong to the A carrier, while 334-666 belong to the B carrier. Later, the FCC allocated more spectrum, which was divided up in strange chunks to fit in the space available in as equitable a manner as possible. The B carrier got channels 717-799 (the B' band), while the A carrier got 667-716 (A') and 991-1023 (A''). Note that channels 991-1023 are actually in a block below the A band in frequency, and that channels 800-990 aren't used.

Actually, there is a lot of evedence that the Historical Christ took most of what he attempted to preach from Buddhism. He certainly patterned his life after the Historical first Buddha. The problem was, his followers didn't have a clue as to Christ's intentions, being probably a nice young Jewish boy, fresh from India, Tibet etc. with a whole new way of thinking. So they did the best thing they could, One of them got stuck with Ratting him out to the local cops. Meanwhile the rest of his followers did the duck and shun thing. Then when he was arrested, and put to death they could make the story of his life pretty much as they saw fit.

To answer a previous question, why pick on "Christians"? Easy, the crowd that uses that handle today are the decendants of Ratters, cowards, and scam artists. They mean well, but with that much baggage, it's easy to see why the "Christians" are as much responsible as anyone for the sad state of Humankind then, and today.

> Or will the fact that coating will keep antenna from
> oxidizing be better in long run . Opinions welcome.
> Thanks,Dennis

There are a couple of things you will need to keep in mind.
The first is called "skin effect" and the second is dielectric effect.

All radio frequencies tend to travel in the very outside layer of any conductor. This effect increases with frequency. That is, the higher the frequency, the nearer the surface the energy travels. What this means is that if your coating is conductive, the radio energy will try to travel in that. If it has resistance, then it will have loss and will reduce the efficiency of your antenna. (This is why coils etc, are silver plated. Silver is about the best conductor there is!)

If your coating is non-conductive, it will change the dielectric constant of the medium in which the antenna operates. In effect, it will change the capacitance of the antenna and may change the tuning. Ideally, you should tune the antenna AFTER any coating, including sleeving, has been applied. The effect may vary from almost un-noticeable to dramatic, depending on the antenna type and coating used. The answer is to check!

Cross-posted to: rec.radio.scanner,alt.cellular

Dear Paul,

For the purposes of cellular licensing, "wireline/non-wireline" has to do with whether the local telephone company is a cellular provider or not.

In the beginning (sounds Biblical, but it's not), the Federal Communications Commission (FCC)
decided to license two providers in each geographical area so as to stimulate competition. In
many areas, the local telephone company was awarded a license ("wireline") and a company that
was NOT the local telephone company ("non-wireline") was awarded the other. This was (supposedly) so that people would have a choice.

In the San Jose/San Francisco/Oakland bay area, the "wireline" carrier ("A-side") is Cellular
One (which is made up of companies including Pacific Bell, the local telephone company), and
the "non-wireline" carrier ("B-side") is GTE Mobilnet, which is not the local telephone company for much of the area.

(Although just to confuse the issue, GTE is the local telephone company in the small communities of Los Gatos and Morgan Hill, but evidently, they have very few customers relative
to the number of Pac Bell customers in the area.)

Is this confusing? Affirmative. But I hope it helps.

Dave

Moot point. Is the US 1900 Mhz techically GSM or is it PCN or PCS
since the classification is appear not to be standardised. In most of
the rest of the world, GSM is broadly 900mhz or in my cell to be very
precise 912.000mhz while PCN is 1800mhz. So what to we really classify
the US 1900 Mhz as?

If it is GSM, will my European GSM SIM slot into a US 1900 Mhz unit
and be GSM. Then what will the implication be for my European PCN SIM.
Will that also work and will it be regarded as GSM, or PCN or PCS??

Confused? If you are not now you soon will be. (Have I heard that
before somewhere?) Global Standardisation is wonderfull isn't it!

Many Canadian and British outfits will ship to the U.S. I theory the
scanner could be siezed in transit but I've never heard a report of this
actually happening to anybody.

Hi,

I am wanting to find a dealer who carries the Optoelectronics OS-535 Scanner interface, and who has them in stock. If anyone reading this message has recently purchased or received a price quote on this interface, I would like to know where they got the info. I am looking to purchase one this week, and want to start gathering some info. E-Mail replies please....

Thanks for reading,

David KD4NUE

4071. Wireline / Non Wireline ?

Newsgroup: rec.radio.scanner
Date: 1997-03-03 00:00:00 UTC
From: Paul Gunn <gunnp@fri.cri.nz>
Message-ID: <331A19F9.639A@fri.cri.nz>
Source record: 205337
Cross-posted to: rec.radio.scanner,alt.cellular

Wireline /Non Wireline?

What does it mean? Can someone (probably someone from the US explain
this to me)?

In New Zealand one company (Telecom) owns the spectrum between 870-890
Mhz
and provides cell phone services. Thus we use channels 1-666. My scanner
sees
of these channels equally should I chose to listen to them. My cellphone
can choose
between Type A and Type B systems, and is set to use both.

What happens in other countries? Why? Is this another case of a US only
thing that
has all others puzzled?

If you wouldn't mind, please mail as well as post replies as I suspect
some posts
get eaten...

gunnp@fri.cri.nz

>more channels?

I can't speak specifically to these models, but on both of my scanners
(PRO 34 and 2006), I've multiplied available channels by a factor of
16 by changing the RAM IC. The "new" channels are not available
concurrently, however. You can still access only the number
originally designed for (200 or 400 in my case) at a time.

I've had the good fortune of meeting many nice folks here on the newsgroups, and as a resource for good information and assistance in our beloved hobby, it can't be beat.

Such an example of this is a fine Gent by the name of Jon Van Allen...

Jon and I have become good friends via these newsgroups, and the internet in general. Jon is very knowlegdeable about radio related matters, and is also an excellent technician.

Recently, Jon offered to do the "clipping" reduction, and "Birdie" mod on my AR8000 scanner. I sent it out to him in West Jordan, Utah, he did the mods, and returned it back to me ASAP...the radio never ran better, and the clipping is gone!

Jon charged me for the parts, and a very paltry fee to cover his labor. I am most indebted for the help he was willing to show another hobbyist.

Jon advised me that he will offer these mod services as a sideline to anyone interested, and will charge for the parts and his time....He is also working on a mod / switch for the AC adaptor charger, so you can run it off ac without worrying about a battery problem, and vice versa.

Anyone interested in modifying your AR8000, or other general scanner mods, give Jon a shout at :

yonnie@wolrdnet.att.net I'm sure he'll be most helpful.

You should turn the scanner off before unplugging the adaptor cord.
Also unplug the lighter end first and *not* the scanner end.

The best thing you can hope for with a RS warranty is to not have to
use it.

It is my contention, that although that police lobbying group
will try to CLAIM that such restrictions would be for "safety"
purposes, the R*E*A*L reason is that they just don't like the
idea of we the peons being able to listen in on their conver-
sations.

OK, folks. Maybe I shouldn't post this, but I'm tired of reading all this crap about importing scanners, etc. If you want to buy unblocked scanners from U.S. dealers it's very easy.
Go to your local city or county government office building and purchase an occupational license for your own business. Call it XYZ Telecommunications Repair Service, or anything like that you want. Send your order to a scanner dealer specifying that you want an unblocked model to be used as test and servicing equipment. Enclose a copy of your occupational license. Most dealers will sell you the equipment with no problem. In most areas you can buy an occupational license without any proof that you actually intend to go into business, and the fees are generally small - here it's $15 - although I have seen it as much as $100. I spoke to one dealer recently who said he doesn't even need to see a copy of the license. If someone uses their laser or inkjet printer to make up a letterhead, then types their order on that, who's he to say that they aren't a real, qualified buyer. There is no enforcement or auditing system to insure that dealers are sellng only to "qualified" buyers.

Brian,

For military aircraft search 138.00 to 144.00 in AM mode, and also 225.00 to 400.00, also in AM mode. There are other areas, such as Army Aviation in the 30 to 50 mHz range, but the majority is 138.00 to 144.00 (tactical) and 225 - 400 (tactical and air traffic control).

In my situation, I found that the recharging plug had become loose. It required that I resolder the jack to the board and repair traces in order to get things working again. It's quite easy, but time consuming. By the way, I have been using the same battery pack since 1992 (Of course I have a second pack to use while the other is recharging.) Keep scanning! :)

Unless you need to add the invert polarity parm (ie. mdt x) what you are getting, is the correct decoding. Just because you can't read it doesn't mean it isn't correct.

Be sure you are connected to the discriminator output. The second version of the software, usually called Newmdt.exe, has the corrected error correction which may help too.

I have found that only about 10% of the Ardis messages in my area are readable. This always seems to be the longer messages.

After I posted my CA list of frequencies, somebody else posted one but I was unable to read it.

>
>How does this work - how can you view an MDT transmission - and do you see
>them all? - wouldn't it be just a flood of characters?

Well, yes and no. Each message has a header and you don't start decoding unitl you get a valid header. I typically get about 95% of the SoCal Ardis network traffic, which is unfortunately very boring, unless you enjoy name lists and appliance repair orders.

Some time ago I distributed a short list of SoCal Police MDT freqs, but I have gotten no response from anyone regarding wether they are decodable with the current software. I can tell you, that some MA police are decodable as are the Houston,TX police.

After that, different systems send different formats. Many are just system status messages, that is why some people are convinced that they aren't getting valid data, just because they can't read it.

Some data is composed of messages interspersed with screen control characters, and it would be nice to view this as originally intended. But beggars can't be choosers as they say.

Hopefully, there will be new versions of this program out in the future and give us a reader friendly output.

Does anybody know if there's scanner tune-up information available on the internet for this scanner? I was given one for free, and it's not too sensitive. I was told it was twiddled with, and I suspect something is out of whack. I'll be glad to pay reasonable costs for a copy of whatever bench/shop manual might be available for this unit. No, I haven't tried Radio Shack yet. The people there are sales-oriented, and don't seem like they want to assist with older products. (Not to mention basically un-knowledgable about most of what they sold 10 years ago). I've been thinking about taking a "lifetime warranty" tube in and see if they'll still replace it ;->. Anyhow, sorry for the rambling, and I'd appreciate any help anyone might render- Web Williams, KR4WM in Myrtle Beach, SC

have FCC-MASTERFILE from GROVE..works great...I don't cut and paste, I
dump to file then I can import or print with no problem. It's great can
look up a frequency if I kjnow the user or look up a user if I know the
frequency...I like the mapping feature too...will let you map all the
transmit sites for a user (ie PD, FD, or Cellular..etc)

>1010 -1015.

A triple scanner in the 1000-1200 range is not as good for cell images in the
896-915 range with a dual conversion scanner. Also I dont think the Pro-60
goes up past 956MHz or 1000Mhz. I would double check this but the
support.tandy.com web page is VERY SLOW today.

You might look into Bill Cheek's Ultimate Scanner Book. He has plans and descriptions for several mods that can be performed on the Pro-2035. Just off the top of my head there is the memory expansion, SCA, Data Squelch, Center-Tuning, S-meter...etc. I plan to try to add a Opto535 board to my Pro-2035 along with a modified CE-232 board for programming the unit in addition to most of the available mods for the unit.

Newsgroup: rec.radio.scanner
Date: 1997-03-04 00:00:00 UTC
From: Mark Seelbinder <seelbind@qni.com>
Message-ID: <331CA8EC.2577@qni.com>
Source record: 205134

So I went out and took advantage of the markdown on the Pro-60. Pretty happy, so far (less sensitive than BC, though.) Except:

When listening through the headphone there is a very faint hiss present when sitting on an empty channel. (Yes, the squelch is closed.) During daytime monitoring where ambient noise is usually higher, this is no problem. But in the quiet evening, when no other noise is present, it gets bothersome. Is this a normal situation? If so, are there workarounds? If not, it's back to the RS store?!?!

Thanks,

Mark

You have the concept and idea right but you have the systems backward.
The A system is considered "non-wireline" and the B system is wireline.

GTE is a wireline cellular provider in the bay area. GTE is a wireline
phone company.

The "A" side of the San Francisco network is operated by the Bay Area
Cellular Telephone Company (BACTEL) as a Cellular One franchise. Pac
Tel Mobile Services was a major partner in Bactel. (PTMS was a Pacific
Telesis company - but Pacific *Bell* was never in the cellular
business)

Of course a few years ago Pacific Telesis divested itself from cellular and paging. Their wireless business spun off into what became Airtouch. This was done so Pacific Bell Mobile Services could go into the PCS business. Pacific Telesis could not have subsidiaries in the cellular and PCS business in the same market.

Now you are probably really confused.

A side note to the beginning of the bay area cellular business... The licenses for cellular markets were given out by the FCC in lottery years ago. GTE did not get the Bay Area wireline market in that lottery, PacTel did. GTE got the LA market. They traded.

> Francisco (not bad for a cordless phone in the City!)
Their range is impressive... anyone with a 800Mhz scanner can hear you for quite a long ways... :)

> What are the offical frequencies used by such devices and are they
> blocked-out by most scanners; like cellular or TV-audio?
902-907Mhz and 920-935Mhz(I'm pretty sure). And no, they are *NOT* blocked... So tell your Congressmen not to argue over cell phones, but PORTABLES!

>

It is not illegal for the out of country vendors to EXPORT 800mhz capable scanners, It IS Illegal to import them though. If you buy one then that makes you the importer. However, as long as you are ordering for personal use, you should be okay because you are a small fish, The FCC is more concerned about the "importers" of large quantity's of scanners for resale in this country.

Well there are a few that are always on my year round christmas list.

Bearcat 3000XLT - Tripple conversion & 400 channels in 20 banks
Bearcat SC150 - 100 channels, 10 quick priority channels, & fast scan rate. I own one of these.....
Bearcat 200XLT/220XLT Same unit but the 220 comes with a extra battery. Both have 200 Channels, fast scan rate, easily programable......

Check out http://www.policescanner.com it's a Real Audio site that
allows you to hear Dallas Police PD & FD, LAPD, DFW Airport ATC, etc.

The Dallas/Fort Worth ATC can also be hear at the following URL:

http://www.audionet.com/simuflite/

The Chicago O'Hare ATC can be heard at the following URL:

http://www.cyberair.com/audio/chiapp/index.html

Wake County Radio Traffic (located near Raleigh NC)

http://www.middlecreek.org/fairview/audio.html

It's a scanner hooked up to a RA encoder

You can hear the following:

Wake County Dispatch
Wake County "Channel Two"
Cary Dispatch (VHF)
Raleigh Fire
Wake County "RESCOM"

Complete waste of time, all you will hear is a broadband buzzing noise. I have a GSM phone and it intereferes with aircraft audio systems nicely. (also the car radio, cassette, tv etc) and all with a buzz buzzing noise.

The GSM cells operate with a system of sharing called time-division multiplexing. Up to 8 phone calls or 7 calls and a paging service can share the same frequency. They are very effectively scrambled. The system is secure, no eavesdropping.

Your scanner doesn't have the correct bandwidth to even begin the decode process, and even the men in dark glasses cannot intercept the calls, they do it at the wire end of the telephone exchange.

You can scan them all you want it won't make any difference.

The attached .wav file is the sound of my phone interogating the exchange for the Call Diversion status. It is the handshaking sound which occurs just before a call is received, then it goes into a continous buzz. It was recorded by placing the antenna near the computer microphone, no receiver necessary. While this was happening, the computer monitor also sufferred interference.

When I first got the radio, i put a couple of semi-used nicads inside
instinctively, and they died within a few minutes. I don't think they
supply enough voltage along most of their discharge curve to work, but I
never tried pst that. Two lithium AA cells last forever.

Jeff,
I have not heard this but that doesn't prove anything. And I assume
you're talking about replacement of their UHF radios? Installing the
computer terminals does not necessarily mean removal of the existing
radio equipment.
The Cary PD has some cars equipped with terminals but they do not
replace the Motorola 800Mhz radios they use.

If you're in San Francisco during the month on March and happen to be near the Curran Theater on Geary between Mason and Taylor you may want to check out 457.5375 Mhz. It's the frequency for all the Stage hands and behind the scenes Director. It's a half-duplex type systems and you can hear the Phantom of the Opera in between the radio traffic of all the Stage hands and Director. I'm not sure what the input frequency is yet, but I have to assume that it's in the 467.xxxx range (467.7375 467.7500 467.7625 467.7750 467.7875 467.8000 467.8125 467.8250 467.8375 467.8500 467.8625 467.8750 467.8875 467.9000 467.9125 467.9250).

If someone has the ScanWare or FCC files for CA, can they please look up the frequencies for the Curran Theatre in San Francisco and post them or e-mail them to me?

Thanks,
Bob

<snip>

Sounds like these GSM phones aren't too good for home use. One of the things I notice when I switched from a 46/49 Mhz cordless to a 900 Mhz digital was that the computer didn't cause interference on the phone. It sounds like these GSM phones cause interference with everything in the house! Doesn't that violate some sort of FCC rule about interference? I'm just remember those words printed on most electronic devices ... 'this device cannot interfer with other devices ... blah blah blah'

: >I should know...I've had one for years (and love it), but I do know it's

The Yaesu FT530 and FT51R can also monitor two VHF 2m frequencies at
the same time.

: The Icom IC2SRA *will* do this on two meters. I know... I have
: two of them (and might be willing to part with one of them :-).

: The "two meter transceiver side" will, of course, monitor any two meter
: frequency, and an extended range of frequencies above and below two meters
: (but not as high as 222 MHz or 440 MHz.)

: The "scanner side" of the radio will monitor any frequency from
: about 25 MHz to 900 MHz or so, INCLUDING two meters.

: So you can monitor one two meter frequency on the transceiver side,
: and another two meter frequency on the "scanner" side.

: I have actually done this. During the aftermath of Hurricane Fran,
: the State Emergency Operations Center (EOC) was operating on 146.88 MHz and
: the Wake County EOC was operating on 147.15 MHz and I needed to monitor
: them both at the same time... and I COULD do so, and did so with my
: IC2SRA.

4152. AOR-8000 and Scancat Gold

Newsgroup: rec.radio.scanner
Date: 1997-03-04 00:00:00 UTC
From: anonid@alt.net
Message-ID: <5fhmv3$239@tofu.alt.net>
Source record: 205200

Does it work for you?

Will it work in Windows 95?

I have had the AR8K and the INF-8000 inspected by EDCO to confirm they are working correctly, but I cannot get the software to control the radio. I have verified that the settings are correct on the AR8K, the INF-8000 is inserted correctly, the com ports are configured correctly, and there is over 600k of the first 640k of memory available.

I have tried it on 3 different IBM compatable pc's and it has not worked on any of them. I have even gotten a new copy of the software to ensure it is not corrupt and is working properly. AFter configuring everything correcty and going to the scan screen after entering upper and lower frequencies to scan between, I must either hold down the up (or down) arrow key, or push it repetedly to make the "computer" keep scanning. If you let up on the button, it stops scanning.

The AR8K does flash "REMOTE" and you can then use the local button to regain local control of the scanner, but the scanner display will not echo the screen display frequency, or scan/enter any frequency from the computer. I have check the scan step and mode to make sure they are compatable, still no go.

I tired to load a frequency file from Scancat into the radio, but that doesn't work either.

I bought a breakout box and hooked it up to verify that the cable was working (although I don;t know which of the lights are supposed to be which color at which time.....

This is very frustrating, as it has been going on a long time, I was misreable without my AR8K, whilst I had it sent back to EDCO for checkout. Now, after god knows how many hours, I still cannot get these things to communicate.

Anyone have any suggestions.

4153. AOR-8000 Frequency files to load into radio.

I use a search from Percon an I like it. The good things about it is
that there are seven different search methods. Also, for it's data
fields, it has freq, name, lat, long, type of service and type of
license.

The bad things about it is that I cannot cut and paste directly from it
and printing freqs is sometime a pain.

Check them out at www.percon.com and decide for yourself!

I just picked up an old 4 channel crystal controlled
Regency MONITORADIO/SCANNER.

Next to the crystal sockets there are four pins with wire jumpers which
corespond to the crystal sockets, and three more pins marked 450-475Mhz,
148-174Mhz, and 30-50 Mhz.

Does anyone know how this band select scheme works and how to set a
socket for a particular band?

Thanks

The only one I've used is PerCon's SPECTRUM. It's the best $30 I've
ever spent on the scanning hobby! I'm sure others will agree.

Note that this is the U.S. version. I've heard that the Canadian
version isn't that great.

4160. 900MHz cordless phones

Newsgroup: rec.radio.scanner
Date: 1997-03-04 00:00:00 UTC
From: Scott Noack <snoack@informix.com>
Message-ID: <331C7775.476B@informix.com>
Source record: 205208

--Scanner-folk,

I have a 900-MHz Panasonic cordless phone and am wondering if my conversations can be monitored? I phone isn't digitized (analog), doesn't use spread-spectrum technologies and is probably low wattage (<2watt). I notice that I have about a 10 block range here in San Francisco (not bad for a cordless phone in the City!)

What are the offical frequencies used by such devices and are they blocked-out by most scanners; like cellular or TV-audio?

I have seen a lot of postings on wanting to monitor military aircraft and
AF-1. The answer to everyones question is so simple that it hides it's
self. Monitor average everyday aircraft band. There is nothing special
about military aircraft. They have one band in the 250 - 350 MHz range.
That is the only special thing about them. Because they are aircraft,
they must ID and fly standard patterns for the areas they are in.

Military aircraft fly very little compared to say United or American
airlines. So, you will not hear much traffic from them. When they do fly,
once they are over the area that the mission is to take place, no one talks.
They have too much to do. You already know that the driver and navigator
are hardwired to each other. So no RF is involved.

The whole point to military communications is not to be intercepted. To
that end, operating freqencies are assigned prior to each mission. So
you really can't sit there and say you will always here test missle
launches on 255.something. You have to do a lot of hunting and a lot of
detailed monitoring to find them. Once you do find them, you will find
communications to be sometimes nothing more than digital data bursts.
Welcome to the Air Force F-22!

I've had the same kind of trouble and, at least in my case, it appears to be related to use of an external speaker. I always turn the radio off before disconnecting the power cord, but the plug is so loose it fairly often spontaneously disconnects. If I have the radio plugged into the external speaker when this happens, zap, there go 200 channels of programming. I've just been running the radio off the internal batteries since I figured out what was going on.

Had mine repaired twice, nothing changed. It's the biggest piece of junk
I
ever bought. Thats is why it is not on the market any more. If it was
any good they would have blocked out cellulare and kept it on.

Good Luck

Source record: 205303

It does not need modified. Add 21.6MHz to the cell Frequency
and you will get an image that is every bit as good as the original
frequency. In your search (src) enter

Wireline 889.890 +21.6 = 911.49 high end
880.830 +21.6 = 902.43 low end

Non Wireline 879.270 + 21.6 = 900.87 high end
870.210 +21.6 + 894.12 low end

In wireline the full range will be covered.

non wire no. of cells =312 - 11 lost =301

Out of over 600 cells you will lose only 11.

Hi Jeff,

ROVER= Remote Out of Vehicle Emergency Radio

BTW, Who ever posted the "BASIC" list forget the most important
freq Tac 1 154.8300 Hot stops, This is the one that all divisions
listen to and monitor especially the Helicopters!!

Good scanning makes good friends,

Mike

Sorry, mike, but you're only partially right. What you said *used* to be true. Under the electronic communication privacy act of 1986 the actual listening to cell phone conversations is illegal; at least in theory. In theory because nobody has ever been accused or convicted of the crime. Nobody has ever tried to enforce it and I don't expect that to change. Of course we all know that lots of people listen in without any worry. One shouldn't do like the florida couple and advertise the the national media that they do it. It should be *very* interesting to see what, if anything, happens to them.

If listening to cellular frequency conversations is anything like
listening to the cordless frequency conversations, I found them
BORING.

Yet, I still would like to get my PRO-2035 modified for other
things which would enhance the unit's functions. I wonder if
there are other "mods" available. I'd be my luck, though, that
one is inclusive with the other.

James or Gord or anybody else;

I have a Welz WS-1000 and the instruction manual states that it requires from 2.2 to 3.5 volts. That would seem to suggest that AA size nicads would work fine except that the manual says to use only alkaline or manganise. What are your thoughts on using nicads with the WS-1000?

Also, although not mentioned in the manual there are two metal pads on the bottom of the case marked + and -. Could they be for a charger that the unit can be sat in?

Barry

If there is no sound at all, I.E. no key beep or anything, then it may be
the earphone socket. I suggest you see if you get sound with an earphone
plugged in. Otherwise it could be the speaker itself.

>I should know...I've had one for years (and love it), but I do know it's

The Icom IC2SRA *will* do this on two meters. I know... I have
two of them (and might be willing to part with one of them :-).

The "two meter transceiver side" will, of course, monitor any two meter
frequency, and an extended range of frequencies above and below two meters
(but not as high as 222 MHz or 440 MHz.)

The "scanner side" of the radio will monitor any frequency from
about 25 MHz to 900 MHz or so, INCLUDING two meters.

So you can monitor one two meter frequency on the transceiver side,
and another two meter frequency on the "scanner" side.

I have actually done this. During the aftermath of Hurricane Fran,
the State Emergency Operations Center (EOC) was operating on 146.88 MHz and
the Wake County EOC was operating on 147.15 MHz and I needed to monitor
them both at the same time... and I COULD do so, and did so with my
IC2SRA.

>The email address of Mr. Wheeler (president of the CTIA) was in the April '97
>issue of POP COMM. I encourage everyone here to bombard his mailbox with our
>dislike of the CTIA and it's beliefs.

I did. Here's what I sent:

I object to the CTIA's concept of "radio privacy". It is not
practical, not enforceable, and it counters virtually every radio
spectrum policy since the original Communications Act of 1934.

The radio spectrum has been considered public by its users ever since
the early days of spark gap wireless. Radio receivers do not diminish
a radio signal, nor are they detectable in any way. Anyone can listen
in to virtually anything on the radio spectrum, just as you would
listen to a commercial broadcast station; and unless asked, nobody
would ever know. The original "Radio Secrecy Act" (Section 602 of the
Communications Act of 1934) was written precisely around this concept.
Radio secrecy is enforceable. Radio privacy is not.

Surly you are aware of how easy it is to modify a scanner. You also
must know that frequency converters are easy to construct and quite
legal. If one of your minions, Representative "Billy" Tauzin, can
modify a scanner right in front of a committee, do you really think
that a foolish law would keep people from doing the same thing in the
privacy of their own homes?

How do you plan to prosecute someone who modifies a scanner, anyway?
Snoop on houses at random until you find someone listening to cell
phone calls? Have you ever heard of the Bill of Rights? How could
you ever hope to enforce such a law?

Encryption over radio is a new concept. Even during the early days of
radio, everybody understood that if you wanted to keep a conversation
private, you had to use encryption.

Yours is the first organization I am aware of which attempted to
implement privacy by proposing legislation against reception of the
signal. How ineffective. How silly. Did you really think the public
would fall for this kind of trickery? You have sold the Emperor some
new clothes, and you think I will pretend he's not naked?

Frankly it would be very advantageous for you to stop this ridiculous
charade. The cellular telephone companies could make loads of money
by pointing out that existing cellular phones are vulnerable (as we

all know them to be). Then they can sell the public new digitally encrypted phones. Your industry will make plenty of money. My rights will not be infringed. We all win.

I did not take CTIA seriously in 1994 when it first began this ridiculous charade with the Electronic Communications Privacy Act (ECPA). And I never dreamed that you would have recruited the likes of Billy Tauzin to grand stand against decent, law-abiding citizens such as Bob Grove. I will not sit quietly any more. We may not have the money you have to throw at Congress; however, my friends and I can prove that your Emperor isn't wearing any clothes. How long before Congress finds out?

I'm offering this as a civil example of how one can win these dweebs over to the side of reason. Next step: Your congressional representatives!

> what the ctcss tone Freq is ? Thanks

A tone board is very useful for frequencies that you can monitor more than one user on. In my area, there are more than 20 agencies using 155.280, and almost 20 agencies using 155.160 that I monitor. As soon as someone keys up on those frequencies, I know who's channel the user is on.

Being able to identify tones will also tell you when you're hearing a new agency on a frequency, and may also be a clue to who the agency is (we have some co-
ordination of PL tones among agencies in some parts of NC). It's very handy when tropo is good.

I use two Tonefinder units (TCF-4) hardwired to 2006s, which work very well. I also run Scanstar on two PCs with another 2006 and 2035. Identifying agency PLs is as much a part of the hobby for me as identifying new frequencies.

Message-ID: <331E26D3.5533@pacbell.net>
Source record: 204983

I had the same problem with my BC-590. I believe it's because the headphone jack uses the same audio that goes to the speaker. Unfortunately, most "in your ear" tiny earphones are higher impedance than most speakers. Hence the problem.

Here's what I did. In an extension cord with mini (3.5 mm) phone jack on one end and plug on the other, I inserted a small attentuator. Values are not critical, but I used 220 ohms in series with the lead from the center contact of the earphone jack. On the earphone side of this resistor, I connected a 68 ohm resistor across the earphone output.

This has the effect of reducing the level to the earphone and the impedance of it as well. It also lets you turn up the volume control more, which means better control of levels.

Values are not critical. Experiment and see what works for you. In my case it greatly improved earphone audio quality.

YMMV.

> better than the TrunkTrackers? Would the TrunkTrackers somehow be
> upgradeable later?

If you'd rather 'upgrade' a PRO-2006 or BC760XLT then there
will be product availble to add to those radios in the form of
an accessory 'box' with LCD display and keypad for alpha-numeric
data entry.

This box will not tie up your Pentium to do trunking unless
you wish to observe (or dump) trunked data to your PC screen
via an RS-232 port for analysis and logging rather than store
it in the 'boxes' memory and review it on the LCD display.

One of the modes the 'box' will allow is a combination of
normal scanning and 'trunking' combined, sort of like check the
trunking control channel periodically (like a priority scan) and
then run through the normal bank of channels in memory. Useful in
cites like Omaha Nebraska which only had one municipal trunking
system last time I checked.

We're also working on the other 'trunking' formats and also PL
tone decode and DTMF decode in the same box. A Morse read feature
has only been talked about so far ...

I would list an URL but we're in the process of upgrading the
site with new images of product and so on ...

To the critics (arron5 et al) I make mention of this for several
reasons not the least of which I don't want to be accused by Uniden
of 'reverse engineering' their product and then copying their product
with minor software changes.

Jim

RL> Hi, All, I picked up a Pro-26 on sale. And while I love its design,
RL> I'm having problems. Seems that the front end is quite prone to
RL> overload...
--
When I bought my first Pro26, I returned it for the same reason. The
2nd unit was much better, so there is a possibility of quality control
from unit to unit. However, the frontend is not as well designed as
with the BC3000, so there are image problems in the air band from cell
phones, and around the 170 Mhz range from 900 Mhz pagers. You shouldn't
have much of a problem though between 140 - 165 MHz. If you do, that
particular unit may be a lemon, or you have some strong transmitters
nearby.
I've modified mine to reduce that interference problem, but it's not an
easy mod to do. I do like the 26's dual power plug arrangement, the
small size and weight, and the frequency range. Audio could be better...

HAVE YOU SIGNED THE BELOW?

If not, don't.

If so, rescind it.

In liberty,

Bill Cheek
PS: Do you wonder what this has to do with scanners?

STANDARD SOCIAL CONTRACT

Between _____ and

THE GOVERNMENT OF CENTRAL NORTH AMERICA

WHEREAS: I wish to reside on the Central North American Continent and; WHEREAS:
The Central North American Government controls the area on which I wish to reside and; WHEREAS: Tacit and implied contracts, including the Constitution of the United States of America, are vague and therefore unenforceable;

THEREFORE, I, THE SIGNER BELOW, agree to the following terms:

SECTION ONE. I will surrender a percentage of my property to the Government, such percentage to be determined by the Government and subject to change at any time at Government discretion. The amount to be surrendered may be based on my income, my net worth, the value of my purchases, or any other criteria the Government may choose. > To aid the Government in determining the percentage, I will apply for a Government Identification Number which I will use in all major transactions.

SECTION TWO. Upon Government demand, I will surrender my liberty for a period of time to be determined by the Government, typically no less than two years. During that time I will serve the Government in any way it chooses, including military service in which I may be called upon to sacrifice my life.

SECTION THREE. I will limit my behavior when and as demanded by the Government, including but not limited to the following: I will consume only those drugs permitted by the Government; I will limit my sexual activities to those

permitted by the Government; I will forsake religious beliefs which conflict with the Government's determination of propriety.

SECTION FOUR. In consideration of the above, the Government will:

A. Permit me to seek employment, subject to any limits which might be determined by the Government, such as choice of career or wages I may accept.

B. Permit me to reside in the area of North America which it controls.

C. Permit me to speak freely, subject to limits to be determined from time to time by the President or his authorized representatives, the Congress and/or the Supreme Court.

D. Attempt in good faith to protect my life and my claims to any property it may have allowed me to keep. [Note: I may not, however, hold the Government liable, or responsible, or accountable in the event it fails to successfully protect my safety or my property. The fact that the Government may deny me the right, or the means, of self-protection places no responsibility whatsoever upon the government for any injury or loss I may suffer as a result.]

SECTION FIVE: The Government may offer various services to me, the nature and extent of which shall be determined by Government and subject to change at any time, and for which I may be charged at whatever rate is determined by Government.

SECTION SIX: The Government will determine whether, and when, I may vote for certain officials, and the relative influence of my vote. The influence of my vote will normally vary inversely with the total number of voters, and I understand it typically will be of little or no consequence. I agree not to hold any elected Government official liable for acting against my best interest or for failing to uphold oaths or promises, even if those promises motivated me to vote for them.

SECTION SEVEN: I agree that the Government may hold me fully liable if I fail to abide by the above terms in their entirety. In the event of such failure on my part, the Government may confiscate any property that may remain in my

possession, and may imprison me for a period of time to be determined by the Government. I also agree that the Government may, at its discretion, alter the terms of this contract at any time, with or without my knowledge and

assent..

> cheaper than the $450 asking price from the above mentioned?

I have nogt purchased an AR8000 from these people, so I can't tell you
if it is safe or not. But it does sound a little to good to be true.

Just make sure if you do order from them to:

1. Order COD
2. Open box when UPS arrives and verify contents BEFORE YOU PAY.
(UPS does not mind if you do this)

As far as restoring 800 MHZ all you need is a computer, serial
Interface for the AR8000, and Software, such as SCANCAT, SCAN*STAR, or
similar.

Hope this has been of help

When I bought mine, the sales droid told me that it really drains
batteries fast. He was right. I got about 5 hours of use from my first
charge.

Without a schematic in front of me, all I can do is relate what I know
as common audio muting schemes. In some radios, the audio output amp
stage is always "on"...the collector voltage is there, and only the
signal input to the base is gated on and off. In that case, there will
be some noise all the time because of Gaussian action and
such...anything that can make it to the base of the transistor will be
amplified. Another way to control audio is to have the squelch switch
run the gate lead on a CMOS switch IC, which typically only attenuates
by about 20 dB (or down to one-tenth). If you're handy with a
teensy-tiny soldering iron, and can determine which method is used, it's
possible you can re-do the output circuit. F'r instance, have the
squelch circuit turn off the collector voltage to the PA, which would
mute the output (you may have to add a transistor, possibly a Darlington
to do this). If the radio uses a CMOS gate, try putting another one in
series with the first, both controlled by the same control line.
Cutting the audio output to 1/100 instead of only 1/10 may help.
Either that or something else. <--------- my universal disclaimer :)

Hi Stephen,

I have a Pro 26 as well. I find it to be a sensitive radio that often stops on faint signals, say from some local RF interference. The built in attenuator helps quite a bit. The audio has room for improvement. Some things I do like: it's very small and light weight. I was also considering the 3000xlt, but having to use only the proprietary nicad packs and not regular batteries put me off. Let me know what you think of your '26...

Hi Todd,

I found that the DATA Skip feature on my Pro 26 works best when I search
with the squelch adjusted at least to 1/2 of maximum. The radio hangs on
the data signal for a few moments, and then moves on. So, try adjusting
the squelch on your radio when using the DATA Skip feature.

I must admit, I was a bit surprised when I called Opto about the
OptoLinx...they said that they redesigned the unit and explained some of
the changed. Forgot to mention that the tape out jack was gone.

For those of you who don't know the differences are:

No more custom input
No more tape out
Dedicated full duplex port
Dedicated Scout port
Only two dip switches (local/remote and full/half duplex)

I can't say if it works any better or not.

This probably won't help, but if it's any consolation my Uniden
BC-220XLT exhibits the same phenomenon. I called Uniden when I noticed
it just a few days after purchase, and they said it is a normal
ocurrence having to do with the audio amplifier design.

Bob Parnass (I think) suggested perhaps a filter of the appropriate
design, notch or low-pass, could help, but depending on the frequency of
the hiss you might lose a significant portion of the desired audio as
well. Perhaps an external DSP filter would be the best solution.

I've lived with the hiss for a couple years now and have gotten used to
it, so haven't bothered experimenting with filters. Perhaps once I get
the basement finished . . .

Good Luck,

The frequency you listen to is actually converted to other (IF)
frequencys inside your radio. Its part of the superhet design. It
makes life much simpler when it comes to filtering and amplfying
signels. Otherwise you would need to tune each stage for each frequency
step. as for the number of IF's its usaully related to the range of
coverage of the radio. The more spectrum the more IF's. Almose all
radios end up at 455 Khz as their last IF. If your scanner covers 30 to
512 Mhz it probably has 2 IF's. One at 10.7 Mhz or so and another at
455 Khz. The signel is first converted to 10.7 Mhz then to 455 Khz.
If your scanner has 800 Mhz coverage then there is one more step Usaully
in the 400 Mhz range. I hope this helps...Jim

if the hiss is just white noise a filter probably wont help. My BC 255
and pro 43 both do that.

We use 900 MHz GSM here in South Africa with no interference problems.
Oh, yes, just one: whenever I move from one cell to another and I'm
playing a cassette on my car stereo, I get about 3 seconds of really
loud drum knocking over the music. Strangly, its not the case all the
time, only between certain cell zones!

Doug,
Sounds like you are using lower-end capacity nicads like the 700mAh type. If so, then four hours is to be expected. The Pro-60 does use a little more power than more modern rigs but it's not that bad(from what I the 'old brain cells are telling me). Might also be useful to know how "old" they are and how you charge them.
Have you thought of buying hi-capacity cells? For some added cost, you can buy upwards of 1100mAh cells. It obviously will take longer to charge them but they'll last longer if that's what you want.

I have an Optoelectronics Scout for sale. It's a scout model 25 with a frequency range of 10Mhz-2.8Ghz. It requires a CBAR interface to interface to the AR8000 and 2700 which I have and will provide. It's in good shape and works well, I had it recalibrated and cleaned at the end of October 96.

I'm asking $300 for the Scout and CBAR Interface, please e-mail me at mwaldron@ohio.net

Uniden BC-230XLT handheld scanner. Covers 30 - 800 MHz bands and more. Like new, in original box with all accessories, including 2 nicad battery packs and desk charger. This scanner is in mint condition; entirely as new.

In previous posts, I asked $195. I've since learned that this scanner can be had new for that price, plus shipping. I'm now asking $150, including shipping via FedEx. My apologies to those who offered this price earlier; I was operating on bad data. Email if interested. Thanks.

>trunker info file? The programmer indicated there was a minor error
>checking problem with mdt.exe I don't know if the posted version is the
>fixed or the unfixed version.

Yes.

When I originally put mdtstuff.zip there, I did not include the
original message or source code; just the compiled exe. That was a
bad idea, so I updated it about a week ago. It now includes both the
original text as posted by lord@heaven.com and the C source I compiled
from which contains the fixes recomended in the trunking article by
arron5@geocities.com. If you look carefully at mdtstuff.c from that
zip file you will see the changes identified by comments. (The whole
article by arron5 is in trunker.zip at the same FTP.)

Whether you got the older zip that did not include the source or the
newer one that does, the exe is the same. All copies that I have
posted to that FTP directory do include arron's fixes.

>Holmdel and Bloomfield?

Hi Ed,

The NJTP New Brunswick cars (the station is now called Cranbury - they moved to a new site a few years back) use the Troop C frequencies. The GSP Holmdel cars also use the Troop C frequencies. GSP Bloomfield can be heard on Troop B and Troop C frequencies. Actually, all NJTP talkgroups (Newark, Cranbury, Moorestown, and Car-to-Car) are simulast on the Troop C frequencies, and all GSP talkgroups (Bloomfield, Holmdel, Bass River, and Parkway Headquarters) are also simulcast on the Troop C freqs. So if you are in the range of a Troop C site controller, you can hear the entire turnpike and parkway!

Here is a summary:

TROOP A TROOP B TROOP C
NJTP

Moorestown YES NO YES
Cranbury NO NO YES
Newark NO YES YES
C/C YES YES YES

GSP

Bass River YES NO YES
Holmdel NO NO YES
Bloomfield NO YES YES
Parkway HQ YES YES YES

>>and why? they are the best.

NO ONE here can adequately answer your question, Max, until YOU perform a little "homework" first:

What do YOU want to hear in YOUR region???

Do a little research. Check your local Scanner Club or Ham Club for information. Your local Radio Shack store can assist, too.

YOUR needs might be completely different than MINE, Max! What *I* consider to be the "best" might not suit YOUR NEEDS at all!!!

That spec means that a signal with an intensity of 5 millionths of a volt will generate an audio signal in your radio. 5 microvolts is very sensitive, but your HH will perform even better at home with an external antenna connected to the BNC antenna jack. Attach an AC adapter and your scanner's performance will rival most base units on the market today. (An inline attenuator might be advisable depending on your location)

Yes you can get a tone board for the 9000XLT.

Are you in Canada? Ontario maybe? If so, the OPP use a CTCSS
frequency of 107.2. Many frequency books also list CTCSS tones.
Trial and error also works!!

I wasn't telling anyone how to run a newsgroup. I was telling you how to avoid sounding like someone desperately in need of a life. I'm sick of even responding to your plaintive outcries, and frankly, the bulk of this newsgroup bores the crap out of me, so I'm out of here anyway. Go ahead and trash RadioShack and eavesdrop on cellular telephone calls. I'd recommend looking elsewhere for spiritual advice.
By the way, have you considered an "I am an idiot" tattoo?

| I do know for a fact that the FCC is taking a hard look at the AR8000
|under the new, stricter interpretation of the rules against a scanner
|being "readily modifiable." It is my opinion that they will require AOR to
|rewrite the radio's firmware to prevent cellular restoration. Note, this
|is opinion only, but an opinion formed after several telephone
|conversations with Julies Knapp, chief of the FCC's equipment
|authorization division. He would not be more specific, only saying that
|the AOR was one of several radios they were re-evaluating, and that do to
|the increased congressional pressure this was the "number one issue" at
|the FCC right now. So, there you go, for what it's worth.

Maybe what we need are scanner kits whereas all the RF/IF stuff is all
factory aligned and then you plug in your own processor board. In keeping
with this strategem, the kit manufacturer would supply a stupid processor
capable of doing only the most simple things... :-) we Americans are
paying the price for the lack of indiginous manufacturing facilities...

What's most amusing about the current round of attacks on scanner
users is how the CTIA is acting like THEIR the wounded party when
in fact it is they that destroying traditional American freedom to
listen to the airwaves...

However, I saw something interesting that might provide a means of causing
angst among the CTIA membership quite legally like they cause to scanner
users. (How many folks recall the series of advertisments in magazines
like EDN, Electronic Design and Electronics by Motorola around fifteen
years ago wherein they portrayed a typical criminal as a man with a scanner
and a bolt-action rifle so as to push their encryption stuff?)

_Microwaves_and_RF_ magazine had a short news article about the CTIA complaining
about "ABUSIVE" (!!!) practices of local government concerning getting cellular
site approvals! Perhaps scanner listeners need to form "concerned community
organizations" that are outraged over the increasing levels of electromagnetic
radiation irradiating their communities, not to speak of the unsightly antennas
that contribute to the demise of the ambience of the community. Get a lawyer
whose also a scanner listener to file friend-of-the-court stuff for free or
a small fee. After all, why should these profit making companies get off
scott free in destroying not only our traditional American values of being
able to monitor whatever frequencies we wanted to, but also our visual ambience
to an uncluttered view as well and not pay a price? Time
is money, and the greater a monkey wrench you can slow into their expansion,
the greater they will feel under the gun. Hmm, can you imagine "The Concerned
Radio Listeners of Upper Podunk object to the increased levels of electromagnetic
pollution that would result from the approval of new cellular service towers..."

1/2 :-)

>their Pro-60. After a full chagre, I'm lucky if I can get 4 hours use
>out of the "NiCads". Does the Pro-60 have a high current draw or do I
>have a bad set of "NiCads".

If you are handy with test equipment, use a digital milliammeter
to determine if your PRO-60 draws any current from the battery
while it is powered off. It should draw virtually no current.

This passage is from my PRO-60 review in Monitoring Times:

"...Our PRO-60 requires more current than the PRO-43, PRO-26, and
BC3000XLT. While scanning, our PRO-60 draws 99 milliamps.
That's 13% higher than the PRO-43 and 23% higher than the PRO-26.
Our PRO-60 consumes approximately 130 mA (milliamperes) while listening
to a signal at moderate volume, about 20% more than the PRO-26.

While turned off, our PRO-60 draws slightly more than
2 mA from a 7.2 volt source and almost 3 mA from a 9 volt source.
That's significantly more current than the 0.010 mA
PRO-26, the 0.045 mA BC3000XLT, and the 0.5 mA BC200XLT.
Let's extrapolate the figures to calculate how much charge would
remain in a 600 mAH (milliampere-hour) NiCd battery pack
if it were fully charged, then left inside our unused PRO-60
for one week.

The battery pack will discharge from two different sources:
the current used by the PRO-60 and the current attributable
to the normal self discharge process.
While powered off for 7 days (or 168 hours),
the PRO-60 will consume 336 mAH or 56% of the pack's charge.
The self discharge rate for a NiCd battery is about 1% per
day at 70 degrees F, so self discharge will rob our unused
battery pack of about 7% of its charge, or 42 mAH during the week...

By the end of the week, we've used about 378 mAH (336 mAH + 42 mAH),
depleting the 600 mAH NiCd battery pack by 63%!
By contrast, the same battery pack left in a PRO-26 for
one week would lose only about 7% of its charge because the PRO-26
consumes only 1.7 mAH per week when powered off...."

The early PRO-60 I tested for my MT review drew 2 mA current from
the batteries while it was off. That's a defect (and

publishing this information drew the attention an attorney -- but
that's a whole 'nother story).

True, , they usually 'simulcast' on the civilian freqs.

>There is nothing special
>about military aircraft. They have one band in the 250 - 350 MHz range.

That they do.

>That is the only special thing about them. Because they are aircraft,
>they must ID and fly standard patterns for the areas they are in.

EXCEPT in the MOAs (Military Operating Areas)

>Military aircraft fly very little compared to say United or American
>airlines.

Well, Maybe in YOUR area, but in MY area, they get pretty busy on a
daily basis.

> So, you will not hear much traffic from them.

NOT true. There is a LOT of chatter. You just have to know WHERE to
look, that's all.

> When they do fly,
>once they are over the area that the mission is to take place, no one talks.
>They have too much to do.

Again NOT TRUE! there is a constant chatter on the tactical freqs as
well as communication with the ground units.

> You already know that the driver and navigator
>are hardwired to each other. So no RF is involved.

That's true

>The whole point to military communications is not to be intercepted. To
>that end, operating freqencies are assigned prior to each mission. So
>you really can't sit there and say you will always here test missle
>launches on 255.something.

Again NOT TRUE. The frequency assignments are very standard. They
even give them names, like "Sport" or, "Loomlobby", "Shadetree", etc.
these are for specific areas, and for specific purposes. You can
program a set of these KNOWN freqs into a scanner, and sit there all
day long, listening to them drop bombs or whatever. In the USAF,
however, there are, a 'set' of freqs that are assigned to aircraft
when they go through their briefing. These are usually very
predictable though.

> You have to do a lot of hunting and a lot of

>
>js

Well , , , I don't know where you live, but from my location, I can
hear the entire High Desert area of California and parts of Nevada,
and I have a fairly comprehensive set of freqs for this area. Right
now, for example, I'm listening to the ranges at China Lake,and an
F/A-18 dropping Rockeyes. Every day, same ole stuff :-}

You might also try purchasing a few aviation charts for your area.
They often have tower and center frequencies published for the
military as well as the civilian band.

Yup! Especially 'cause they don't know how a real radio should perform
and because it looks like a 'puter.

Frankly, WinRadio's specifications leave an awful lot to be desired.
It looks computer freindly. But like so many goofy things in the
computer industry, it is all flashy stuff and little substance. The
radio part of it is pretty pathetic. Even the specifications, as
vague as they are, can tell you that.

I'd stick with the seperate radio and computer control scheme. Let
radios be radios and computers be computers. There are damned few
engineers who can design a good radio these days and even fewer who
can interface it to a computer well. WinRadio doesn't have one of
those folks on staff. It shows.

Barry, I currently own a Standard C508A HAM radio. This is the same chassis that the Welz is built on. Right after I purchased The radio I bought the Charger and battery kit. I returned it within three days. It was the worse $30.00 purchase I have ever made. It consisted of a proprietary NiCad battery pack and a charger that took 8 hours to charge the unit. The only way you can charge the battery pack is in the radio itself and you cannot use it while it is in the charger. Do yourself a favor, buy extra AA batteries and carry them around. The radio is great, the charger is a joke! Can you please send me ANY info/personal opinouns on the Welz, I'm looking to buy one.

-Thanks, Ben

>awhile back does anyone know if this rumor is true?

They have them now. Occasionally you hear some of the "rookies"
calling the dispatcher on how to input a status code into them, and of
course the dispatcher can't tell them as they don't use the same
little computers and are not always trained on the use of them.

They still chat a lot - especially on channels 6 and 7! :)

It is possible that not all the cars have them, or maybe it was for
HP? or maybe it was to upgrade them or something....or maybe they
lease the ones they have.....don't know.

as to replacing the walkie talkies, etc - I would think that for any
foot chases, stake outs, etc, that they would still need radio of some
sort - they might make more use of the PC for calls, etc.....it's just
hard to imagine putting something VISUAL in a patrol car versus
something AUDIO....it's easier to listen to a radio dispatch while
driving, than to try and read a screen.....although you could put 2
officers in every car, have in car HUDs......

but I don't think that raleigh will go high tech for a while :)

Much of Atlanta went to a digital 800 MHz trunked system for the
Olympics and stayed there. Some of the outlaying areas still use UHF
systems.

Go to my radio web page and look for "Atlanta Frequencies" in the
scanner section.

Looking for a Uniden MR8100 scanner. If you have one for sale, or
know of one being available, please msg me at cfortner@ciaccess.com

Thanks very much!!

4293. Trunktracker - be first on the block or wait for the next generation?

Newsgroup: rec.radio.scanner
Date: 1997-03-05 00:00:00 UTC
From: ralphc@bellsouth.net
Message-ID: <331cc190.4047976@news.atl.bellsouth.net>
Source record: 205152

I've seen the Monitoring Times article on the TrunkTrackers coming out, and read some messages here about possible other radios coming out later, perhaps able to handle other systems.

I'm not a real scanner fanatic, I may be interested in one of these radios, but I can wait a few months if better ones may be coming down the pike.

Anyone heard any rumors etc. about _other_ upcoming radios that may be better than the TrunkTrackers? Would the TrunkTrackers somehow be upgradeable later?

Message-ID: <331d0666.13091296@news.ktb.net>
Source record: 205160

What is the policy for the 10% discount at Radio Shack. The
saleperson droid told me that the discount doesn't apply to items that
are currently on sale like the PRO-60 handheld. Is this true? BTW,
I'm seriously considering gettting this scanner for a handheld unit.
Any comments about this radio? Already have the 2006 base unit.

Does anyone still get the discount coupons from Radio Shack in the
mail? I haven't gotten one in a while and I already have the RS
Credit card so I can't get the sign up discount.

TIA

: >> enough ppl out there adventurous to keep it going for several years down the
: >> road?

I think that WinRadio will be around for a long, long time. At this time
there is no other wideband radio that is 100% PC controlled and at it's
price, it's hard to beat. The possibilities are endless. You can also
write your own software for it if you like it to do something the original
software don't. Other software companies are starting development on
something for this radio.

Now people like Bill Cheek (Hacker of the PRO-2004/5/6 series scanners)
will be doing detailed reviews, updates, modifications and hacks for
this radio in his World Scanner Report. Also a company called The Imitsu
Emporium will be selling accessories for the WinRadio like auto switching
antenna control, filters, etc.

With backing like this, ease of setup/use and good receiver performance,
I have no doubt that this radio will be around for a long time to come
with many people creating new software, etc. Now with Bill's attention
on this radio and excellent support from WinRadio's Rosetta Laboratories
it can't loose. Performance is similar to the AOR 3000A type scanner.
The only thing to watch out for is antenna placement (this radio is more
sensitive to antenna placement then most others).

This is a real hackers radio, especial for software programmers.

4303. Re: PL/CTSS Information

Newsgroup: rec.radio.scanner
Date: 1997-03-05 00:00:00 UTC
From: mulligan@ACM.ORG
Message-ID: <5fj2gn$2t9@hopper.acm.ORG>
Source record: 205162

devans4465@aol.com asked:
> ... is there a list with all of the PL/CTSS codes available?

From the FAF - Frequently Asked Frequencies
on ftp://oak.oakland.edu
as /pub/hamradio/docs/misc/scanner.faf

CTCSS (PL) Frequencies

Freq (Hz)	Designator EIA	Ham	Freq (Hz)	Designator EIA	Ham	Freq (Hz)	Designator EIA	Ham
67.0	L1	01	110.9	2Z	15	179.9	6B	29
71.9	L2	02	114.8	2A	16	186.2	7Z	30
74.4	WA	03	118.8	2B	17	192.8	7A	31
77.0	L3	04	123.0	3Z	18	203.5	M1	32
79.7	SP	05	127.3	3A	19	206.5	8Z	
82.5	L4	06	131.8	3B	20	210.7	M2	33
85.4	YA	07	136.5	4Z	21	218.1	M3	34
88.5	L4A	08	141.3	4A	22	225.7	M4	35
91.5	ZZ	09	146.2	4B	23	229.1	9Z	
94.8	L5	10	151.4	5Z	24	233.6	M5	36
97.4	ZB	11	156.7	5A	25	241.8	M6	37
100.0	1Z	12	162.2	5B	26	250.3	M7	38
103.5	1A	13	167.9	6Z	27	254.1	OZ	
107.2	1B	14	173.8	6A	28			

Motorola differs from EIA with: XZ (L1), XA (L2), XB (L3),
YZ (L4), YB (L4A), ZA (L5). ICOMM does not use 97.4 and uses one
less than the amateur numbers above that (i.e. ICOM #25 = 162.2).

Be advised that the BC3000 does NOT cover 520-760MHz. This is the UHF TV band and contains audio channels that can be heard using Wide FM mode. Some people just don't care that this region is missing...and some of us do! ;-)

Same here.
But, with the new hysteria about cell-capable scanners, it could be
that,
any day now, someone with the power will recognize that these scanners
are being imported, and will close that particular leak.

Personally, I'd hate to be the first to lose an investment that way!

Here is an excerpt from the CTIA Wireless '97 conference...

How "Phreakers" Learn Their Trade

Phone hackers, also known as 'phreakers,' are resourceful, but often don't have to look far for the information they need to ply their illegal trade. The most common sources of information include cellular phone user manuals and the web sites of phone manufacturers. Others follow the "because it's there" creed, adding to their knowledge base by taking on and overcoming the challenges of rewiring systems to their satisfaction.

I do know for a fact that the FCC is taking a hard look at the AR8000 under the new, stricter interpretation of the rules against a scanner being "readily modifiable." It is my opinion that they will require AOR to rewrite the radio's firmware to prevent cellular restoration. Note, this is opinion only, but an opinion formed after several telephone conversations with Julies Knapp, chief of the FCC's equipment authorization division. He would not be more specific, only saying that the AOR was one of several radios they were re-evaluating, and that do to the increased congressional pressure this was the "number one issue" at the FCC right now. So, there you go, for what it's worth.

I have a New Radio Shack Pro 2036, 200 channel scanner, that I just pruchased from Radio Shack. It has a manufacturing date code of 4A4. The store had it laying in the back room for several years and didnt try to sell it until just now. The original box is missing but the manual, telescoping antenna and power supply are included.

When new it sold for $319. I have $150 in it and will sell for that. Shipping included

The TrunkTracker will only work on Motorola systems, AFAIK. :(

4318. WESCOM (W. Will Cty. Comm. Cent., Illinois) Frequencies

Newsgroup: rec.radio.scanner
Date: 1997-03-06 00:00:00 UTC
From: vickery@tornado.svs.com
Message-ID: <vickery-ya02408000R0603972155440001@brownfox>
Source record: 204877

I reside in Northeastern Illinois, near Joliet and Plainfield, IL - and Plainfield, IL is served by the Western Will County Communications Center (WESCOM). WESCOM also serves the communities of Lockport and Shorewood. In the Poilce Call volume for this region, I have found a few frequencies for WESCOM, but none that appear to be repeaters after listening to them. I always get one side of the conversation - usually the simplex from the officer making the call.

If anybody has a database or resides in this area, that could look up WESCOM (Western Will County Communications Center), it would be grately appreciated.

Thanks,
Jeff Vickery

>x-ray baggage check?

I carry mine often (including a frequency counter) and have never had a problem. Unlike computers, I don't think I've ever had to even power them up. The new airport security regulations may be more severe though.

However, do NO attempt to use them on the aircraft. Each receiver is also a transmitter and can truly screw up avionics (electronics) on the aircraft. Unless you like running into mountains at 600 mph, leave the things in your luggage once your board the aircraft.

However, it can be fun to listen in the gate area, especially at smaller airports where there aren't 50 frequencies in use. If you live near a small airport, check to see if it has a pilots store. You can buy really inexpensive books which show airport frequencies for areas all over the country, including maps of the airport and approach areas, beacon freqs and locations, tower frequencies, ground control frequencies, etc.

Radio Shack has some very nice scanners. The PRO-2045 is one of them, which
I own and enjoy listening to...I'd like to think that RS introduced the
masses to scanners and SW units. For those that want something more
professional, there's always ICOM, AOR and the like, but for the masses
Radio Shack still moves more scanners.

Yes, as for a computer controlled VHF/UHF they were (I think they were
the first VHF/UHF computer controlled receiver even before the AOR 2001
sold to the general public).

: When you say that the antenna placement is critical, are you talking
: about an external antenna? I don't see how an internal one would work
: too well. In either case, can you be more specific? How far away from
: the computer, Etc.

Obviously an external will be far superior to an indoor antenna. The best
would be a separate antenna setup for different bands. I was talking about
the indoor antenna that comes with the radio which many people may use
when first receiving the radio before installing an external one. If using
an indoor antenna, the farther away the better and close to a window. I
wouldn't lay an antenna right ontop of the computer.

: Also, anyone know who is giving the best price on the WinRadio?

Check the WinRadio website at "www.winradio.net.au" to find a list
of US dealers and then check there web sites for prices if there on
the net (I think alot of them are).

: I know it is cell-blocked in the U.S. Is this a hardware or software
: block? (The next question I'll let you guess at) :)

I'm sure you will find out in the World Scanner Report by Bill Cheek.

Here is some more info on this radio.

Frequency Range: 500kHz to 1300MHz

Tuning steps: Programmable from 0.5kHz to 1MHz in AM, FM narrow and FM wide.
(5 Hz in SSB)

Sensitivity: AM SSB/CW FM-N FM-W
0.5 to 1.5 MHz 5uV 2.5uV 1uV *
1.5 to 30MHz 1.5uV 1uV 0.35uV *
30 to 1000MHz 1.5uV 1uV 0.35uV 2uV
1 to 1.3GHz 5uV 2.5uV 1uV 3uV

* Wideband FM not used below 30 MHz.

Scanning speed up to 50 channels/second

Check out the WinRadio web site for more details and you can email them
for any info not on there site. Also you can download the WinRadio software
and if you don't have the card it will run in demo mode.

Message-ID: <01bc2a52$42416c80$443e00d0@cstool.cstool.com>
Source record: 204934

I am learning as fast as I can but must ask for help on this. It might be a *really* stupid question. A thousand pardons if it is.

I am not permitted to have a visible antenna in my subdivision. (Had I known I would take up scanning as a hobby, I would have bought somewhere else!)

I have a large (9' in height, two car garage area with a fair amount of slope) space above my garage that I could put an antenna in. I think most of the antennas I have looked at would fit OK. My question is: Could I expect reasonable performance with the roof in the way or would I be throwing away money on a high performance antenna?

I have a PRO-2006 and an AR8000 and I would like to link them both to a single antenna. My favorite ranges are 30mhz-160mhz. If you can suggest a good antenna and a way to cable it to both, I would appreciate that as well.

Please reply to: millerg@cstool.com

Source record: 204937

For Sale:

Radio Shack Pro-43 Scanner with 800Mhz unblocked.

This scanner is in excellent condition. I have decided to sell it because it is not being used and I could use the money for other interests.

It has the original rubber-duck antenna, high capacity Ni-Cad batteries, original instruction manual and box, and also the accessory wall charger/power supply.

This scanner has never been dropped or abused or even carried on a belt, rather it has been used inside a residence.

Price: $265 and I will pay for the shipping (UPS ground, insured)

Please email me if you are interested or if you have and questions. I can also be reached by phone at: (619) 562-5960.

Thank you,

>>> Davida - NI6X <<<

In order to get the radio to go back into BAND XXXXX, you must first have a valid 440 freq in one VFO and a valid 2 meter freq in the other VFO...then select the 2m VFO, turn the radio off, then do the KNOB-PTT-LAMP and it will work...it works for me every time.

>

It may not, BUT!!!!!!

Why not get a small 7809 voltage regulator install it in a small (i mean
small) box. This
would convert anything from 10.5 - 35 volts down to 9 volts. You might want
to
install a small heat sink as well in case your scanner draws a lot of
power.

I installed mine in an old lithium battery box from a PC. Installed a small

heat sink and added an LED just for grins. works great.

You probably will have to order the 7809. Most places don't stock them.

>MAKE SURE THAT THE RADIO IS SET TO CR and NOT CR,LF
>OR THE PROBLEM YOU MENTIONED WILL OCCUR

To reinforce the need for expert mode for CR delimiter, if you run the radio in novice mode then switch to expert mode and configure the delimiter for CR, then switch back to novice mode, the radio will automatically revert back to issuing a delimiter of CR,LF

That is: CR delimiter *cannot* be used in novice mode. If the software you are running needs CR, then you MUST be in expert mode to implement it.

Also, a study of the manual reveils a note that after any changes to the configuration of the AR8000, the radio should be switched off then back on again before the changes can take effect. I guess this is to reset the internal software of the radio and for the radio to pick up the new settings. (In reality, I have noticed that powering down and powering back up again is not always neccessary BUT occasionally I get a problem with a hang up, switching off/on sorts it out.

Have fun - Enjoy!

TO: RADIO USERS
RE: In-Ear Receivers / Radio Ear-pieces
FROM: Don Medine
EMAIL: bumper09@ix.netcom.com
DATE: 03-06-97

I recently found a distributor of Radio Ear-pieces, which can be used for law enforcement. The cost of most ear-pieces are about $70.00 (Complete). The kits includes three ear-pieces (for perfect sizing), fourteen inches of coiled, clear audio tubing, an In-Ear Receiver, and a radio connection cable and jack. I priced one of these kits locally for $129.00. I would like to pass on the offer made to me.

There are several great tactical advantages and applications for In-Ear Receivers. These devices do not minimize your peripheral hearing ability.

K9 Officers
Traffic Officers
SWAT Officers
Street Crime Suppression Teams
Narcotic Investigators
Patrol Officers

I am a police officer and have used In-Ear Receivers for the past three years. I recommend them highly.

Please feel free to call me if you like additional information or availability.

Thanks,
Don Medine

The cellular calls that you are picking up in the 890-915 range are images
of the actual cell calls. Also, yes the sportcat will pick up cordless
phones around the 43.xxx - 49.xxx area. Have fun and happy scanning.
Also, welcome to our ng.

We don't have a print on it nor one to take apart yet, but usually in ICOM cloning cables there is an active circuit inside the DB9 connector. Not that it would present you any difficulty to build, just know that it's more than soldering wires.

If you would like to buy one, they're forty bucks. You also need the software, for $25.

Call us if you'd like to order either.

You could add a GE-*/MDC decoder board to the radio, but it may be
more expensive than you want.

The boards them selves are about $75-100, the display is another
$300-500 depending on type, features etc..

I am hoping that one of the scanner control software packages will add
this feature for the OS-535 etc. as my county is working to implement
a G-* system coutywide.

Hi,

Name is Gary and I have for sale a Kenwood TM-733A
Duel bans mobile radio. This radio is only three months
old and is in excellant condition. Reason for selling is
that I bought it on a close out wim and did not really
(NEED) it. It comes with warranty, Backlit mic, Duplexer,
Manual and box. I paid 395.00 for it and would like to get
380.00 for it and I will pay for the shipping in the US.
I think this is a Good deal since a new one comparable to
this radio is around 460.00 new. This radio has the removable,
remote face plate if you want to mount raio seperately.
I do not have this cable.
No trades

Call cell phones boring...most of the time they are but the occasional
call really turns out to be something. I heard a FBI conversation on cell
phone dealing with a local murder. Their actual radios were digitally
scrambled but they still used cell phones...great scanning.

You'd be amazed at the number of phone sex calls you can hear..great for a laugh

You can hear spouses fighting. In a small town, I had a friend listening
to cordless phone calls...he heard the next door neighbors daughter fixing
to sneak out for the evening, he called the house as soon as she hung up.

I've heard drug deals and everything else.

I might add, I rarely listen to the scanner much anyhow!

Just my 2 cents.

Grady

Dumb logic.

Cellular phones are not scanners. They operate in a licensed radio
service under the effective control of the licensee.

Tell the FCC. They might even agree with you. But it wouldn't matter.
The regulations they have written on this matter were not their idea.
They were ordered to make regulations by congress.

It's called Images, most lower end Uniden and RS scanners do this.

It should receive cordless on the normal cordless channels.

Hope this helps.

Here it is the original posting:

From: KDAHLQUIST@news.delphi.com (KDAHLQUIST@DELPHI.COM)
Newsgroups: rec.radio.scanner
Subject: Re: Los Angeles Top 10
Date: 10 Jan 1995 01:16:35 -0500
Organization: Delphi Internet Services Corporation

Karl's Top Ten LA Frequencies:

10.) 154.830 LAPD Hot Shots
9.) 147.735 Ham Radio Earthquake Repeater (instant "felt" reports)
8.) 859.4375 LAFD Basin Dispatch (good in riots)
7.) 858.4375 LAFD Valley Dispatch (good in floods)
6.) 450.8500 KFWB-AM Remote Broadcast (Pete Demitriou/Armor Clad Crime

Reports)

5.) 42.340 California Highway Patrol Pursuit Channel (in Case OJ gets
out)
4.) 482.8625 LA County Sheriff Dispatch 5 (Palmdale, Lancaster,
Countywide)
3.) Any 450.xxx frequency during OJ Trial recess.
2.) 450.725 KFI-AM RushLimbaugh 9:00am to 12 Noon

and the number one frequency in Los Angeles:

1.) 507.2375 LAPD 77th Division (more homicides per sqare foot than
any
where in the country, although, down 40 percent this year.)

is the LAPD HOT SHOT TAC 1 a repeater or is it simplex?
I tried to get the audio net people to add it to the scanner,and they said
they once did but heard NO traffic.
I assume if a scanner is located within LA it COULD hear TAC 1?

Jeff

Source record: 205018

I recently saw a posting from martyn@intecc.co.uk (Martyn Allison) selling AR8000s, no gaps, for $450. I enquired about this to him and he implied that they were selling about 10 a day to the US due to this posting. Has anyone purchased one of these units?

Just trying to be careful about getting taken. I have never purchased anything over a newsgroup before and have no idea how it works, how to protect yourself, how to secure the deal, etc...

Any help would be appreciated.

Also, if I decided to buy one local that does have the US gaps, how easy is it to set it back to 500KHz~1900Mhz with no gaps? Can you buy one cheaper than the $450 asking price from the above mentioned?

4378. Dealing with Dave Schertzer

Newsgroup: rec.radio.scanner

Source record: 205019

Hello all,

Last week I purchased a DTMF butt set from Dave Schertzer. Saw his ad on these newsgroups.

The unit he sent was in better condition than he had described, arrived in three days, and he was kind enough to include an instruction manual not mentioned in his post.

I know Dave has other equipment for sale. You are safe in dealing with him. He delivers more than he promises. Dave's email: subbustr@whidbey.net

Good to see warning messages about guys who do not do honest deals. Better to see messages from people who did get treated well. We should bring schnooks to the group's attention. We also should advise on people who treat others fairly, even though in a perfect world that should be the norm.

Popular electronics Sept 1993 issue has a similar circuit . For the oscillator they use 2 gates of a 4069 (hex
inverter) and a 3.58 MHz TV color burst crystal. The output is divided by 1000 by a 4040 (twelve stage counter). This
gives a 3.58 kHz output.

Thank you for the information.

Let me state that I am probably the oddball here, but I am one
of the few who is NOT interested in listening to cellular. Believe
it or not, if they are anything like the cordless conversations of
past, I found such conversations totally....B*O*R*I*N*G!

I noticed you listed general mods for most scanners. What I
was/am interested in knowing what types of specific mods are
available for obtimum performance of my PRO-2035.

A couple of people have sent me private e-mail. But ALAS, I
accidentally erased one (of two) message from someone con-
cerning mods of my PRO-2035.

Soooo.....IF ANYONE SENT ME E-MAIL RECENTLY, CON-
CERNING THE ABOVE, CAN YOU PLEASE RESEND?!?!

I have an excellent condition tone/code finder for sale with the interface cable to use on scanners. Very useful when 2 agencies are transmitting on same frequency. With comprehensive instruction manual. Asking $175.00

E-mail to Fbals@aol.com

4383. Above 1300 Mhz

Newsgroup: rec.radio.scanner

Many scanners are capable of receiving above 1300 Mhz.
But what is there to listen to above 1300 1300 Mhz?

Jeff,
I have a new web site that has some of radio stuff on it.
I have a page dedicated to frequencies in and around the
RTP area. Start at http://www.qsl.net/n2mca/ and go to the
Radio Monitoring page. Toward the bottom is a link is a link
for RTP frequencies.
As I get more time to work on this web "stuff", I'll add
more information and frequencies.

From: Rich Wells <wellsr@ibm.net>
Message-ID: <331E53E3.45C@ibm.net>
Source record: 205027

Well I finally finished my evaluation of the new Icom IC-R10.
Man does that radio have a lot of stuff to cover!

Anyways, I have a new web page that I'm just starting to play
with. I've posted the R10 review there along with my Scanner
Model FAQ, Scanner Dealer FAQ, and a few other tidbits.

From my home page(see bottom of this posting), go to the
Radio Monitoring page, find the IC-R10, and then click on
review.

I'll be adding more stuff as time goes on and I learn more
about this HTML stuff. Any constructive feedback would be
appreciated...please be gentle ;-)

I show no listings of repeaters related to this frequency. Some
temporary bases, pagers, and simplex. That does not mean they do not
use repeaters though. Sorry, I am no longer within range to monitor
this as I have moved to Oxnard from San Pedro (June 93) and will soon
move to Twentnine Palms. I will continue to share what info I have
and post as needed.

Hi again Jeff,

Tac 1 Hot Shot LAPD is a simplex channel but is heard from anywhere in the greater LA City area. It is the only frequency that covers all the other Tacital Frequencies especially if they would involve the other high profile units like swat or helicopters. This is the frequency that the news crews listen to the most in get the "inside info"!!

Good scanning to you,

Mike

Jeff,

I really don't mean to be rude, and wish I had more time right now to write a nicer-sounding response.

The bottom line is that (in terms of US military aviation comms) you're mistaken in just about everything that you wrote! Some parts of what you wrote might sound sensible, but are not accurate representations of general US military aviation communications at all.

4397. Icom IC-R10 vs Alinco DJ-X10

Newsgroup: rec.radio.scanner
Date: 1997-03-06 00:00:00 UTC
From: aohanian@wr.com.au
Message-ID: <857643475.23582@nachos.wr.com.au>
Source record: 205038

To all who have been defending (and bagging) the IC-R10...

First things first, throw the ruddy antenna and get a good one! The one that comes with it is quite good compared to the one that came with an R1, but ruddy useless. I use an old rubber ducky from a 220XLT and it boost VHF to no end and makes UHF slightly more useable.

OK, well for around a month now I have been eagerly reading the newsgroups to see what people think of the IC-R10. I traded my AR8000 in for one about 3 months ago and must say that I have only been muffled by 2 things....

1) The dreaded slow scan speed (though I am hounding ICOM regularly for a mod. I am sure I am on their black list by now... Still, when I want something!!!!!!!! :-O)

2) The wide NFM B/W (15kHz really is too big for me in Australia, cause there are alot of strong data channels beside weak voice on the standard 12.5kHz and the voice gets blasted by the data. Interestingly, the FM filter is quite non-linear with a bias to the lower side. Also, the WFM filter is outta whack with weak broadcast band sigs being 50kHz off).

Apart from this, the only other thing that does frustrate, but not muffle me is the lack of selecting scan banks (one or all - all being quite bad with the slow scan speed).

Voice scan is useless as weak modulation of voice gets wiped completely (fair enuff I suppose, the Police really should speak louder...). SIGNAVI is even more useless. Bandscope is OK, but should be better. AFC is OK when cold, but tends to shift the display 1kHz off when the unit is warm.

I find that sensitivity is very close to my old MVT7100, much better on HF (could do with a NAM mode as it is really that good in HF). Maybe the MVT was slightly more sensitive on UHF, but not by much and I live ina hig RF area which gave the Yuppie a hernia on 70Meg, no such prob with the ICOM (and I get far greater distance outta the ICOM on 70Meg than the Yuppie had a hope of doing.... Forget about the AR8000 in this regard!)

Overall it is much much much better than the AR8000 in performance (but not software wise - somebody give me the ROM image and I'll reprogram the bugger for Tim the Toolman Taylor speed in ruddy assembly if need be!). HF was a chore on the 8000 as the stupid LCD refresh controller used to make low band reception buzz everytime the signal meter flickered! No such prob on the ICOM.

Also most impressed by weak signal handling and RF crap rejection. the AR8000 used to massacre weak FM signals. Sure, the squelch opened but all i'd get is a rush of wind. The ICOM will make a dirty weak signal quite

readable indeed. By memory, it's weak signal handling would be ever so slightly better than the MVT7100. As for crap rejection, the ICOM is the only scanner that I have owned which tolerates the 3 huge TV TX towers about 3 kays from me (with pagers galour on them!) Not even the MVT was immune.

So now to reality. Ok, so the scan speed is now irritating me. I was actually quite keen to try an MVT9000, yet with a price of nearly $1300 for-bloody-get it! Which leaves me with the Alinco DJ-X10.

The picture on their current catalogue show the DJ-X10 as a larger unit than the ICOM (it is pretty deceiving as phot's go, but it is in the same case as the Alinco handheld tranceivers). It has a dual VFO (like the AOR) and an electronic SQUELCH and VOLUME control (+/- buttons on the side).

According to the rather small features guide it has...
Same modes as Icom but with freq range increased to around 2gig.
Bandscope (hopefully better than Icom) and some sorta peak search (maybe an optoelectronics style RF finder built in...)
1200 channels with 20 searhc channels.
Full alpha display.
Undoubtedly a faster SCAN/SEARCH speed!!! (ruddy well better be).

That's about all the info I have. If I had a scanner (haha) I would have put a piccy of it in the group...

So I am now awaiting the DJ-X10 to test out. As to whether I will get rid of the R10 for the X10 (similar or what???) is a good question. With all the bugs in the R10, I am still very happy with it. With the leatherette case it looks just like a mobile phone (a boon for me cause I drive with it and Police are rather arrogant around these parts when it comes to proving their superiority..... :-|). So the X10 would have to be pretty bloody good to make me give up the R10.

Final comment is that the R10 reminds me alot of my old ICR7100. Damn good unit that was. Unfortuantely the need for an external antenna and my need to live with the parents reulted ina most upsetting sale of the R7100. DAMN! Wait.... the R7100 used to scan faster than the R10. DOUBLE DAMN! :-)

Ace has a www site which tells about
the TRUNK TRACKER.

Accessing their site: h/p.ace-communications.com

is causing my Pentium to come up with the menu:
Possible Security Fault if you go ahead
You go ahead and the screen locks up for ACE.

They are in the Search Engines and when I access
straight from that source, same thing occurs.

anyone have any idea of what the problem is that
keeps the site unaccessable....

question mark.

Doug,
Sorry but I can't recommend any since I typically do not use them.
I use either the ni-cads that come with the radio(typical 700mAh) or
Panasonic alkalines.
I buy my batteies in bulk from DigiKey. They carry a few different
lines and have good prices if you buy in bulk. I know Panasonic makes
some hi-capacity ones...will look them up when I get home and let you
know.

Perhaps someone with hi-capacity ni-cad knowledge would care to
inject relevant input that would prove helpful to Doug?

Hello, I have the following CB radio equipment forsale/trade:

- Realistic TRC-490 Navaho SSB/AM base station /w stock mike
(stock, never opened)
- Eico 700 Frequency Counter
- Para Dynamics PDC67 desk mike /w power supply
(much like the Sadelta Echomaster Classic)
- Para Dynamics PDC5 SWR/power meter & matcher

I would like to sell/trade all of the above as a package. Items I am
looking to trade for are:

- Scanner (radio, not image ;)
- R/C Equipment (cars, planes, etc...)
- Computer Equipment (hard drives, ram, motherboards, etc...)

If you have any questions, or are interested in making a deal feel free to
drop me a line.

Thanks...

Chris

Hey - do you know how long it takes to program all the frequencies in?
Probably more time than he spent in jail. :)

Wow! Somebody burns the midnight oil (Rich posted at 1:19 AM).

Rich's R10 review is thorough and comprehensive. Excellent piece of work. Deserves to be published. Should be read by anyone with an interest in the R10.

We still have a few R10's and R8500's blocked and unblocked for sale. Unblocked to companies who provide us with an appropriate piece of paper. Same price for either blocked or unblocked.

R10's are $489 + UPS from Maryland. R8500's are $1899 + UPS. Yeah, Grove throws in a converter for cellular if you understand the ramifications of that. However, we offer a 2 year warranty on receivers. ICOM's warranty is one year, and that's all most dealers offer. We extend it another year for free. Service available only through us after 1st year.

We can take your check over the phone and ship immediately.

Any commercial ICOM (receivers and two way, NO AMATEUR) available from us, as well as service, tech support or accessories. 25 years in business, twelve years with ICOM. ICOM is our only comm line, and we know it inside and out. "Friendly, competent service".

Approx 120 ICOM pieces sold in last few weeks as a result of orders starting from this newsgroup.

Call if we can help.

Regards ..... Steve

Looks like uniden was a little ahead of the game, huh? Remember
CompuScan???

When you say that the antenna placement is critical, are you talking
about an external antenna? I don't see how an internal one would work
too well. In either case, can you be more specific? How far away from
the computer, Etc.

Also, anyone know who is giving the best price on the WinRadio?

I know it is cell-blocked in the U.S. Is this a hardware or software
block? (The next question I'll let you guess at) :)

Joe M.

Please respond on the newsgroup.

If that's the only problem put a couple of pin diodes across the input
and they crush any signal larger than about .6 volts or so.

Correct me if I am wrong, but isn't a review simply a report of what you observed? If it was defective, it was defective. You didn't say anything that was not supported in fact, right?

What was the result of the attourney's attention?

Sounds right to me. if a cell phone switches channels/freqs. then it
is a scanner.

>====================================
>Email address is barryo@fastlink.com.au
>Please remove the * from the return adddress when replying.
>Unsolicited commercial emails are not wanted.
>Responses to my article are welcome.

Lets do it like this. Why doesn't someonee purpose to the FCC that all
unencoded signals are legal ro recieve and listen to on read via
packet. But on the other hand any encoded/encrypted transmissions will
be illegal to decode/unencrypt and whereas unlawful to listen to/read.
Problem solved for the time being.

Peace & Be Wild,
Lord Bane

Richard,
When I travel, it is not uncommon for me to bring along anywhere
from 4 to 8 radios plus a slew of ni-cads, alkalines and antennas
all packed into a single camera gear backpack. It goes right through
the X-ray machine and I have NEVER been asked to see what is inside!
Makes you feel warm and fuzzy doesn't it? ;-)
Of course your mileage will more than likely vary. Just be sure
to have a good set of batteries in the radio(s). If they do want to
take a look at it/them, they will ask you to power them on. If you can't
show they can be powered-up you might not be going very far with them.
Sometimes they just give them to the flight crew who give them back
to you after you land at your destination.
And they shouldn't care that you have your radio(s) as carry-on.

Strong signals,

Interesting. I usually only buy items from those individuals I know and trust. I have purchased from them COD and for the heck of it, asked the UPS driver(at least 2 or 3 times) if I could examine the contents of the package to ensure proper handling and verify contents before paying him/her. The driver flat-out refused to let me do this....all times.

Guess I'll have to call the UPS office to see what their official policy is for COD w.r.t package openings before payment is made.

I did not find the stock antenna that offensible. It outperformed the BC3000 on VHF lo-band and 800MHz. Granted, it did suck the life out of signals on VHF hi-band. 450/460s was acceptable but definite room for improvement.

[snip]
> I find that sensitivity is very close to my old MVT7100, much better on HF
> (could do with a NAM mode as it is really that good in HF). [snip]

Wow...our results couldn't be much more different! I used the whip from my MVT-7100 to compare the MVT-7100, AR8000, R10 and R1. The R10 was a tough call between a tie with 3rd place R1 or plain old 4th place. Was definitely not anywhere near the 7100 in overall HF performance. It was closer to the AR8000 but still lost overall.

Icom must be shipping radically different units to US and Australia. Guess you got the one with good HF and stinky antenna. I got the good antenna and stinky HF! ;-)

[snip]
> So now to reality. Ok, so the scan speed is now irritating me. I was actually

4433. 12v in on a 9v Pro-37/62

Newsgroup: rec.radio.scanner
Date: 1997-03-06 00:00:00 UTC
From: Kevin Kilkenny <kilkeke@state.mail.us>
Message-ID: <331F27E2.71E5@state.mail.us>
Source record: 205074

On the Pr0-37 and 62 the power adapter recommended is 9v. Is there a safty factor to allow using 12v from other adapters or auto battery. I would guess that ones cigarette lighter might be 13.5V+ to keep your car battery charged. With car not running would the 12v from the car battery melt anything.

4434. Bearcat BCT-7 mods wanted.

All PRO-60 owners:

I just bought a PRO-60 this past week and I am not convinced that a mod
does not exist. With your help, we may be able to find one.

I was trying out different keystrokes and discovered the following combo.
I don't remember seeing this one in the owner manual. Please help me
figure this one out:

Hold the "1-ENTER" keys during power up:

1. short delay with a blank screen.
2. then, the display goes into test mode and illuminates all characters.
3. when you then push a number or manual, the radio resumes scan with the
following test freqs:
1. 30.000 fm 41. 30.000 am 81. 30.000 wfm
2. 512.000 fm 42. 54.000 am 82. 54.000 wfm
3. 760.000 fm 43. 87.495 am 83. 87.500 wfm
4. 999.9875 fm 44. 98.000 am 84. 98.000 wfm
5. 30.000 fm 45. 87.500 am 85. 107.950 wfm
6. 54.000 fm 46. 107.950 am 86. 108.000 wfm
7. 87.495 fm 47. 108.000 am 87. 126.000 wfm
8. 98.000 fm 48. 126.000 am 88. 137.000 wfm
9. 87.500 fm 49. 136.975 am 89. 155.000 wfm
10. 107.950 fm 50. 137.000 am 90. 174.000 wfm
11. 108.000 fm 51. 155.000 am 91. 225.000 wfm
12. 126.000 fm 52. 174.000 am 92. 350.000 wfm
13. 136.975 fm 53. 224.995 am 93. 400.000 wfm
14. 137.000 fm 54. 174.005 am 94. 450.000 wfm
15. 155.000 fm 55. 225.000 am 95. 512.000 wfm
16. 174.000 fm 56. 350.000 am 96. 760.000 wfm
17. 224.995 fm 57. 399.9875 am 97. 894.000 wfm
18. 174.005 fm 58. 350.0125 am 98. 999.950 wfm
19. 225.000 fm 59. 400.000 am
20. 350.000 fm 60. 450.000 am
21. 399.0125 fm 61. 512.000 am
22. 350.0125 fm 62. 760.000 am
23. 400.000 fm 63. 894.000 am
24. 450.000 fm 64. 999.9875 am
25. 512.000 fm
26. 760.000 fm
27. 894.000 fm
28. 999.9875 fm

Do you see any patterns here? Look at channels 1,2,3,4 and how they don't
repeat themselves after that, but the others do. Also, the channels

represent the band limits (channels 1,2 and 3,4 is what we want). I don't know, just an idea I have. Also, maybe the delay during power-up is a time to enter another sequence to open up the band, or maybe it's checking to see if a certain diode or resistor has been removed?

Let's work together with this and keep each other posted on the newsgroup. Email me directly if you find anything else or have addition info. Thanks.

Paul,
racine@ibm.net

4436. Re: Icom IC-R10 vs Alinco DJ-X10

I bought my 10 here in Australia. Have not tried HF on an outside
antenna yet but I am using a telescopic (from my Opto R 10).
HF works much better than with the ducky and vhf is greatly improved(
local police operate their repeater links in the 78-79 mhz range)
If I ever find the sod who stole my R 10.......
My only complaint with the Icom is the scan speed but have no regrets.
Brian

For Sale:

Bearcat 300 scanner in excellent condition.

Scans 10cps
50 channel memory in 5 banks
Service search
Hit Counter
Tape Recorder Relay
The usual bands (no Mil Air or 800MHz)
Blue Fluorescent display

A good scanner. As a matter of fact, this was Uniden's top of the line scanner.

$75 includes shipping.

>to clean things up, but still the performance suffered.

>Save your money and locate a GRE Superconverter for $30 - $40 more

Hi,

Is the GRE radically different than the RAMSEY unit (in terms of
sensitivity and LO leakage to output port)? I have one but think it's
not sensitive enough (maybe I expect too much?). I do agree with Gary
that a ready built AND ALIGNED/TESTED unit (along with a metal case)
is a much better deal. I made my decision that way. One thing I don't
like about the GRE unit is it's right-angle output connector: I'ts
good if you have the unit on the table and connect a rubber ducky/whip
antenna directly to it, but a pain to connect a coax from external
antenna (the coax has to come from above(!)...:-).
Good luck and happy scanning!

regards,
techno

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

I wasn't sleeping in the Ericsson base station class nor is this ever
mentioned in the documentation as a 'cell site' function. RS-553
(analog AMPS) doesn't even have a command for 'give me sidetone
cellsite'
either.

Can you site a reference for the above info ('phone itself requests
it'). (I think what we're gonna find here if we 'study' the subject
is that sidetone is created in the phone.)

Thanks.

Jim

4444. R8500 mod corrections

Newsgroup: rec.radio.scanner
Date: 1997-03-07 00:00:00 UTC
From: jwa@tellabs.com
Message-ID: <5fpq79$gor@tellnews.tellabs.com>
Source record: 204835

I hate the vi editor! Every time I try to post something, there's
errors!

Hopefully this repost is correct.

Operating the Icom R8500 in other contries.

If your traveling abroad and you want to re-program your R8500 to match the
version in that country. Use the table below.

Version #03 #05 #02
Programming
Resistor AUS DEN EUR FRA USA
R516 X X
R517 X X X
R518 X X X
R455 Z Z Z

X = populate the position with a 3.3k ohm 603 size surface mounted resistor
Z= populate the position with a 1k ohm 603 size surface mounted resistor

Remove the top cover and locate the Main board. It's towards the back of the
radio where the speech option is installed (see the owners manual). R516,
R517 and R518 is located in the right hand corner inside the small metal
can (there will be 4 resistor positions with 2 positions populated the top
position is unknown). The small metal can is located on the right hand
side of the main board. R455 is located between the optional speech module
and the larger metal can (R455 is also unpopulated and it's to the left of
R140) . The larger metal can is located towards the middle and off to the
left of the main PCB.

If you can't find a 603 size surface mounted resistor, carefully unsolder an
exsisting resistor and re-populate it to the other position. R455 can be
replaced with a zero Ohm resistor by shorting the position with a fine
stran of wire taken from a ribbon cable.

After the modification, the R8500 will lose it's memories and the radio
will require re-programming.

I have been an active scanner listener for many years and am going to be purchasing a new scanner soon (my current scanner is almost 15 years old). I can purchase "out of the box" scanners from Canada that have continuous coverage including cellular bands.

QUESTION: Can I legally own one of these in the US, and have it shipped from Canada with no customs problems, since all scanners I've seen listed here are cell-blocked?

Any info would be greatly appreciated.

Thanks.

I have a HP 5328A 500 MHz counter for sale. A friend that used it a a radio station he used to own gave it to me, and I want to get a smaller portable unit. This works just fine- friend told me it was tuned shortly before he gave it to me, and I've had no problems using it now for ~1 year. Has 3 input channels- the third goes to 500 MHz. Has freq., period, ratio A/B channel, etc. It also has an HPIB interface on the back for if you've got an interface to that.

Asking price: $450 - I'll pay shipping to continental USA.

Email for more info.

Any opinions on the RS Pro 34 200 chanel? I can purchace one like new
for $100. Will recieve cell phone.

4451. Aircraft HF freqs/map?

Newsgroup: rec.radio.scanner
Date: 1997-03-07 00:00:00 UTC
From: Steve <slassen@metro.net>
Message-ID: <33210A97.3C2B@metro.net>
Source record: 204842

Does anyone know where I can get a fairly detailed list of HF
frequencies used in the enroute/overseas aircraft band?

Some frequencies I have been listening to are:

All USB:

5.574 MHz (San Francisco)
13.354 MHz (Honolulu)
5.696 MHz (?)

Also, if there are any maps indicating the waypoints that are mentioned
by the pilots, etc..., that would also be greatly appreciated!

Thanks in advance,

Steve L.

4458. Re: Do cops really use radar?

Newsgroup: rec.radio.scanner
Date: 1997-03-07 00:00:00 UTC
From: autonthusd@aol.com
Message-ID: <19970307035000.WAA21063@ladder01.news.aol.com>
Source record: 204884

Yes, cops do use radar. I've been using radar detectors for the last ten years and haven't received a ticket in this time. You must also use common sense however as a detector alone is not enough to save your ass from all tickets.

I love hearing cops defend the absurdly low speed limits which they never seem to follow. Without fail, whenever I see a cop he or she is travelling 15-20mph over the limit. Don't give me the typical bullshit answer that cops "are trained" to drive well above the speed limit. I don't know of too many agencies that send their officers to high performance driving schools such as Bondurant, Skip Barber, etc.

Remember 25 years ago when states had speed limits of 75mph and above. This at a time when cars had skinny bias ply tires, drum brakes, and suspensions that couldn't handle for shit. Now that cars have high performance tires, excellent brakes and suspension systems, there is absolutely no reason why speed limits shouldn't be 75MPH or higher. Any cop that tells you speed enforcement isn't for revenue enhancement, is lying his ass off. If departments are that hard up for cash, why not ask the legislature for more funds. This way cops could get back to dealing with real crime, not wasting their time on people driving 11MPH over what is an artificially low limit in the first place. So yes, I would highly recommend getting a detector or whatever else evens out the playing field. Also make it a point to fight every ticket in court. Make the cop work for your money!

Just my $.03

Source record: 204886

The last statement is wrong! Only illegal to monitor cordless and cellular phone conversations... there's approximately 20 other type of telephone transmissions over the airwaves that you can monitor, and it's legal, so far, until those clowns on the hill change that!

Commercial Airlines
GTE Airphones
Railroad Phones
Ship to Shore Calls
And Many more!

Check out Tom Knietle's 'Tune In On Telephone Calls' publication and you'll see the facts!

But, once again, cellular and cordless ARE the only illegal telephone calls you are not suppose to monitor... that's what the eggheads on the hill say, anyway.

Like the one e-mailer said, keep the darn signals out of my house... the governemt doesn't own the air... GOD does, and he gave it to us to breath and use as a purpose, not for the stink'n govt. to tell us what we can do with it. If ya idiots who own cordless or cellular phones don't want people to hear your conversations, then spend a few more bucks, you cheapos, and buy a scrambled type phone.

Source record: 204887

On 6 Mar 1997 20:44:58 GMT,
in the newsgroup rec.radio.scanner,
"Paul Racine" <racine@ibm.net>
from thoughtfully posted:

> RAMSEY SCN-1 OWNERS:
>
> I am looking at maybe buying the RAMSEY SCN-1 scanner converter, which
> converts 800-900 Mc to 400-500 Mc. Does anyone out there actually own one?
> I want to know how it performs and whether or not it is really worth
> spending $50 on.

I posted this a few months ago:

=== A few notes on the Ramsey SCN-1 800MHz converter =====

The circuit is very basic with "okay" sensitivity, but I wouldn't
recommend it for DX'ing the 800MHz band! However, it is fine for
local reception. A cellular phone antenna works great. Be warned:
The output contains a very large (about -3dBm) 400MHz LO signal
that may overload, or cause images in, or de-sens some receivers.
(Note: the input and output are not isolated, so the 40-400MHz LO
RF energy will make it's way out to the receiving antenna)

Some Tips:

1. Buy some "right angle" PCB mount BNC connectors. The kit comes
with RCA phono connectors!

2. The oscillator that comes with it may cause some problems. The
oscillator is a standard 40MHz TTL crystal oscillator module. The
square wave output is multiplied 10 times to obtain the 400MHz
L.O. The module I received was 1KHz off frequency, which shifted
the output signals over 10KHz, enough to cause scanning problems.
I replaced it with a *80MHz* module and some socket pins. Now the
error is less than 2KHz. The 80MHz module seemed to give better
results (a cleaner LO signal) and a more accurate LO signal.

3. The power supply to the multiplier & mixer circuit is not
regulated and perfomance/sensitivity varies with supply voltage.
You will want to trim the supply voltage for best reception. This
will make the biggest difference in performance. Try adjusting
the supply voltage while receiving a signal. Mine seems to work
best on 8.35V.

4. I also placed some 0.1uF ceramic chip bypass caps at some
strategic places. Mostly this cleaned up the LO signal. The

specific spots were:

a. The supply side of L5 to top ground plane (you will have to scratch away the green solder mask).

b. At the +5V supply pin of the oscillator to bottom ground plane.

c. The supply side of R1 to top ground plane (cleaned up LO).

d. Solder all leads that pass through both ground planes on each side.

5. Clean up the multiplier signal. If you have access to a wide bandwidth scope, connect the "antenna" output to the scope input with a 50 ohm terminator. The signal level should be around 200mVp-p. *Gently* spread apart, or squeeze, L6,7,8 & 9 and adjust them for the cleanest looking 400MHz signal. They will interact, but just adjust them for the nicest looking 400MHz signal (there will be "lumps" every 5-10 cycles). The actual signal level is not too critical.

6. The board is rather big for the size of the circuit it contains (10.5cm x 12cm). It definitely should be built in a shielded case (it does generate a lot of RFI). I would recommend one of those cast aluminum cases for good RF shielding.

Wadda' ya expect for $50!

The laws are so stupid... the ECPA states about the third party issue, when it comes to communications. Why is it the news media (TV, radio, newspapers) are not included in this law, but they want to pick-on poor souls who love the hobby like me and you.

The media listen to their scanners (probably modified for cellular, at that)... they hear a call over the scanner (cops, fire, whatever), they then tell their newscrew to go to the scene and describe what they heard. Listen one time to your local news stations, etc. The police/fire dispatches, that's the first party, the news picks the dispatcher up, they are the second party, the newscrews who receive the message from their news desk are the third party... what the hell is the law then, they've been doing this for years! Why do they, as well as our govt get away with doing this act against the ECPA? Why, because is controlled by BIG BROTHER, you know, those idiots who write stupid laws and try to take away our freedom, and vote each year whether or not they get a raise. As far as I'm concerned, I'd fire everyone of them, including Slick Willy and his sidekick who just broke a law the other day. Are we beginning to see communist takee over.. We The People, bullshit... it's We The Govt. Tell All Ya Nothings Out There What To Do, Who To Do It With, and Where to Pee, but only when we tell-ya!

Dan,

Your FAQ contains two "old wives tales."

#1.) Whether you hear one side or both sides of a conversation has nothing to do with a call being long distance. It really depends on if the phone itself requests sidetone from the cell site.

#2.) One phone does not have preference over another. Channels are first-come, first-served. Handoffs can occur as signals change, or for load-balancing between capable sites.

a frequency counter responds to the strongest local signal. Put one
next to your cordless phone and youll need to be less than a foot to get
a reading. If you put a broadband preamp and tuned antenna you might be
able to pick out something your looking for. I've had a ratshack
counter since they first came out, had no problems with it. Every radio
hobbiest should have a counter and DMM....73's

Another "treatment" is to use a Unix account that sports
tin or similar newsreader. Just enter a nice fat newsgroup (like an
alt.binaries.pictures.erotica group, flag all the messages, and then
email forward all the "hot" or flagged messages to the spammer's
Email address.

I might warn you however, this will piss off the sysadmin of the
ISP who receives this "mail bomb", and if many do this, it has been
known to shut down smaller ISP's. YOU SHOULDN'T DO IT! Remember,
your Email address will be attached to the headers, unless you fix your
account records, or use a hacked account. Again, DON'T DO IT!

But they still fit the definition of a scanner. If it can automatically go between at least 4 channels anywhere in the frequency range of 30 to 999 Mhz, it is defined as a scanner. (I forget what the exact frequencies are) Yes, it is a receiver. Yes, it is in that frequency range. yes, it can automatically change channels. Many cell phones can be put into a test mode to listen to the channels manually! If this doesn't fit the definition of a scanner, I don't know what does.

By the way, under this definition, any radio that has a scan or seek button is in trouble too along with ham radios of all sorts and trunked radio systems.
Tyler

4471. Central PA -HOT!

More than 200 members of the U.S. House of Representatives will spend a
weekend in the Hershey Pennsylvania (10 m e of Harrisburg). Their purpose
is to "foster the spirit of bipartisanship"! What a fantasy!

Anyway, no matter for what purpose they congregate....where there are
big feeling congressmen and congresswomen there will be cell phones...
where there are members of congress there will be "moneychangers"...
....
so there may be some interesting things to hear on the band this weekend.

Effective listening radius up to 40-50 miles?

Only wish it was legal to listen in.....

......I'd run out an buy a used R7000 and a microcassette recorder.

Dave Strasz - Myerstown Pennsylvania (just 11 miles East of Hershey)

There is a chance that the system may not be used in digital mode. Some new systems that are being installed are APCO Project 25 capable, meaning they could be used in digital mode, but are being used in analog mode instead.

I've head that voice quality, and decreasing range are two reasons why many systems operate analog even though they could operate digitally.

How about staking out the known streets where prostitutes hang out and
setup a camera and see which congress rat shows up? I hear the news rags
pay big bucks for those type of photos. There isn't a law (yet)
prohibiting capturing a congress critter on film with his pants down ;-)

Andy

Dumb comment.

My Mororola flip phone IS a scanner. I have the ability to punch in
codes that will literally allow it to SCAN all its channels until it
finds an active conversation.

Get your facts straight next time.

There is a viable argument here that cell phones can indeed be viewed
as scanning devices as defined by the FCC.

4475. Trunk Tracker firmware updates

Newsgroup: rec.radio.scanner

Hello All,

I've been following discussions about the UNIDEN Trunk Tracker (BC-235), and have heard that already it had a firmware update, although it hasn't been shipping in volume yet. Is this true? If so, how can it's firmware be updated? Does it have FLASH EPROM or socketed EPROM?
Thank's for any info.

regards,
techno

(P.S: please email directly in addition to posting here, since our news server isn't very up to date, causing lost responses. Please note that you MUST edit the reply email address (remove the .NOSPAM postfix). This has been done in an attempt to reduce the amount of junk mail received here from automatic/junk/spam mailers. The correct address is techno@actcom.co.il. Thank you.)

Added some more material and made some corrections.

Because of some peoples ability to track-monitor Trunking systems I have updated many of my pages to show the control channels that you should monitor to track trunked systems. More information such as System IDs Fleet IDs etc. will soon be available also.

Some of the popular posts on Trunking and Scanners that are found in this newsgroup can also be found here.

I would like to remove the Ham Radio Section. I can no longer provide accurate information in this area and feel it would be better to let someone else maintain these records. If your interested please let me know.

Remember to press RELOAD when attempting to view changes if you've visited the page recently. In some cases you will get older cached versions unless you do so.

Ron.

4481. Re: bincancel:11 large binaries:AR951:@@NCM

Newsgroup: rec.radio.scanner
Date: 1997-03-07 00:00:00 UTC
From: red@redpoll.mrfs.oh.us
Message-ID: <ARMM-Report-951.a@redpoll.mrfs.oh.us>
Source record: 204907
Cross-posted to: alt.retromod,comp.databases.ms-access,comp.sys.misc,misc.kids,news.newusers.questions,rec.arts.anime.marketplace,rec.arts.prose,rec.radio.scanner,soc.culture.romanian,soc.culture.turkish

Large binary posts do not belong in unmoderated discussion groups.

Please read this entire message, the Bincancel FAQ, and the complete
report (see below) before following up to or responding to this article.

As a service to, and with the cooperation of, other news administrators,
I run a program that searches for, and issues advisory cancels for,
large binaries in the akr, biz, comp, humanities, misc, news, nz, rec,
sci, soc, and talk hierarchies.

I have issued 11 cancels for large binary files (average size 191,571
characters - total size 2,107,277 characters) posted to 9 different
unmoderated discussion groups in the comp, misc, news, rec, and
soc hierarchies as follows:
3 soc.culture.turkish
1 soc.culture.romanian
1 rec.radio.scanner
1 rec.arts.prose
1 rec.arts.anime.marketplace
1 news.newusers.questions
1 misc.kids
1 comp.sys.misc
1 comp.databases.ms-access

This pointer is being posted to each affected group listed above.
Follow-ups are directed to news.admin.net-abuse.usenet.

If you want to see exactly which file was deleted from a particular
group, read the full report in news.admin.net-abuse.bulletins. The
full report can also be found in news.lists.filters and alt.retromod.
Look for AR951 in the subject, or, if your reader supports it,
use <URL:news:ARMM-Report-951@redpoll.mrfs.oh.us>.

The criteria used to search for this batch of large binaries were:
NEWSGROUPS: Unmoderated groups in the akr, biz, comp, humanities,
misc, news, rec, nz, sci, soc, and talk hierarchies
(except for comp.binaries.apple2, comp.bugs.2bsd, and
rec.games.bolo)
BINARY: base64, binhex, uuencode, and xbtoa encoded files, etc.
SIZE: > 100,000 characters [(size * (# of parts - .5)), if multi-part]

For more information about binary cancels, see the bincancel FAQ,
<URL:http://www.southcom.com.au/~geniac/binfaq.txt>.

Please direct public feedback to news.admin.net-abuse.usenet and private feedback to red@redpoll.mrfs.oh.us. In the interests of preventing cross-posted flame wars, please honor the followup-to header and do *not* cross-post your reply to multiple groups. Thank you for your cooperation.

Best wishes,
Dick

Save your money. This is bacially a piece of crap. Even though the price
may be
right, the performace suffers. I built my unit, performed a few mods
mention by Paul
to clean things up, but still the performance suffered.

Save your money and locate a GRE Superconverter for $30 - $40 more

I have an Optoelectronics Scout for sale. It's a scout model 25 with a frequency range of 10Mhz-2.8Ghz. It requires a CBAR interface to reaction tune the AR8000 and 2700, I have and will provide this also. It's in good shape and works well, I had it recalibrated and cleaned at the end of October 96.

I'm asking $300 OR BEST OFFER for the Scout and CBAR Interface, please e-mail me at mwaldron@ohio.net.

Anyone know of any "keyboard tricks" for the SC-150 or could let me know if any exist? I recently found a web page that had some for the BC3000 which I own also. Let me know of any that exist. Thanks...

That's like claiming that an assault rifle with a built-in ballpoint pen
is not an assault rifle.

Most cell phones can be put into a "scanning" mode by hitting the
right combination of keys on the pad, BTW.

Tim.

--Richard,

"Police" bands are a no brainer. Muni, Bart or railroads (caltran)
freqs are a different story. If you let me know what kinds of Law
enforement you want I'll send you a compiled list; choices include:

* Regular dispatch (Filmore, etc.)
e.g. 460.0092, 460.2500, ...

* Golden Gate Park

Then there's always (but very boring):

* Traffic
* Cab
* Tow
* Property Management
* Parking Garage
* Hotel Security
* Hospital

PS If you determine if there are any Fire or Coast Guard frequencies in
the range of 35-1000Mhz, I'd appreciate the info.

4493. Pro-51 patch stopped working!

Newsgroup: rec.radio.scanner
Date: 1997-03-07 00:00:00 UTC
From: Rob Wald <rob@panix.com>
Message-ID: <33207767.F1A@panix.com>
Source record: 204919

I have a 7A4 Pro-51, which gladly accepted the test mode that
puts the normally unreachable frequencies into memory. However,
some time ago the memory was completely wiped and it will no longer
take the power-up key sequence (I can't remember what it is at the
moment) that puts it into test mode. It does perform the other test mode
operations, but not the good one.

Any ideas? I'd like to fix this somehow, but I'm clueless.

Thanks

-Rob

>is there going to be an option for a ge / erikson system? also does this new
>wonder toy - show the names of the talk groups - like the real radios?

Many folks are hoping for a GE/Ericsson compatible unit, but so far Uniden is keeping mum. However, the fact that they purchased the rights to use the G/Wiz technology in their scanners doesn't bode well.

As for the name of the talkgroup, well, the prototypes do not show names, only system ID numbers. However, Uniden has been making a lot of software changes to the radios and I can't help but wonder if this is part of it, or if they are adding alpha capability so you can name the subfleets yourself. Just speculating, mind you.

John

I recently acquired a WiNRADiO. So far, I'm real impressed with it, although I've only experienced the Pro 2004, 2006, & 43 first hand.

Anyway, like others have said, the fact it receives _anything_ is amazing. That having been said, I am kind of disappointed with a few things. You have to program each frequency, one at a time, by hand. There's no way to import my database directly to a file which can be read by WiNRADiO. The attenuator is an on/off switch instead of a slider. That's not a problem with my 2004/2006 because they're less prone to intermod, but with the WiNRADiO, the local setting is too local. Yes, this is an amazing receiver. Sideband tuning is real easy, the controls are simple to understand, and the F2-F12 keys can be used to call up any freq instantly. Wow... Now if I can only figure out how to convert my data to something it can use...

Remember, I've only had the radio installed for two days...

Looking for Kentucky sacnner users. I hane compiled an extensive list of Kentucky based scanner frequencies, but wish to add to the base...I am willing to provide what I have in exchange additional frequencies...I do realise that we all search available data bases and may have duplicate data, however, it may be mutually worthwhile for such an information exchange. NO...I have no ittent of compiling or publishing any such list...this is just a simple request for frequency exhange for mutual listening pleasure.
Send any response via this news group OR e-mail TO
WALCHWL@WKU.EDU

4504. Question about homemade antenna idea

Newsgroup: rec.radio.scanner
Date: 1997-03-08 00:00:00 UTC
From: andye19@mail.idt.net
Message-ID: <5fsgi5$b3s@nnrp4.farm.idt.net>
Source record: 204780

I just purchased a PRO-60 (while it was on sale last week). I intend to use it to listen to aircraft (I work for Bell Helicopter and like to hear our flights), as well as police/fire/EMS and local news stuff in the Dallas/Fort Worth area. I want to use it both in my car and at home. In the car, it seems to work fine, but I live on the bottom level of an apartment complex and am thinking of ways to boost my reception without buying a larger antenna. I can't mount an antenna on top of the building as far as I know, so I came up with a homemade idea and wanted to bounce it off some folks who know more than I. If I run a wire (type unknown, will determine later--suggestions?) around the inside of my apartment, will that improve things at all (assuming I can connect it to the scanner via a BNC)? Please email responses to me at andye19@mail.idt.net. Your insight and advice is greatly appreciated!

Happy scanning,
Andy Entrekin

4505. R.S pro-51 with date code of 7A6

Newsgroup: rec.radio.scanner

Hello all.

I`v just got a new R.S Pro-51 scanner.

it has a date code of 7A6 (7.96).

its cell base band is blocked and i know i cant crack it whith the test mod.

but i know that some mod`s can be done on it to get it work.

if there is some 1 who can make this mod, id like to know about it
any help will be very uesfull.

Source record: 204782

Yes you can do anything with the talkgroups you can do with regular frequencies. Scan all, lock-out, scan one.

You will also see what other groups are talking with the repeater icons on the top of the display.

It can only do trunk or conventional at one time.

I am interested in buying the UBC 3000 XLT from Javiation in the UK.
Has anyone out there done this? Is there anything you would do
differently, having now gone through the process? What is the duty?
Is there any drawback that I should be aware of? Thanks in advance.

Thank you, Steve, for a very concise dissertation on the ordeals of getting into and around in India. The only one thing I can add, is to have a good supply of Lomotil, or Amodium AD with you. TD (traveler's Diarrhea) is VERY devastating, and can be fatal. (dehydration) My experiences in India and in Pakistan parallel yours almost exactly. What REALLY makes it tough, is that there is no booze there, and the food is inedible. bummer!

as far as US customs is concerned make a declaration of the radio BEFORE
you go so you can bring it back without duty . Most scanners are made
outside the country

There is no mod for it. If you want to listen to cell calls just listen
to the images.....or get a down converter. Thats it.

4513. Cellular on PRO-60

Newsgroup: rec.radio.scanner
Date: 1997-03-08 00:00:00 UTC
From: sparkes@fast.net
Message-ID: <5fsnaa$5i0@news1.fast.net>
Source record: 204789

I was fooling around with the 'Direct' search on my PRO-60 the other night when I stumbled onto a cellular
transmission. I was searching in the 137-142 MHz area when this happened. I investigated further and
found a few more 'cellular' freqs. in the 137-142 MHz range. I then tuned in the real frequency on my
R-7000 and the below table shows the real freq and the image that I found on the PRO-60

Image	Real Freq.
138.03	886.83
141.13	893.13
141.76	893.76

These are all that I found so far, but the interesting thing is that the second and third pairs are exactly 752
MHZ apart. I thought this might be the pattern but the first freq. pair (138.03/886.83) doesn't duplicate the
sequence. They are 748.8 MHz apart. As I find more info and maybe a conversion equation or pattern I
will post. If anyone else can confirm my findings or find new pairs, please post.

From: HOUNDDOG <HOUNDDOG@prodigy.net>
Message-ID: <3321E80A.EA5@prodigy.net>
Source record: 204791

Hey CTIA fuckers. Yesterday I was in my local Radio Shack outlet and noticed that the PRO-2026 was $119. I asked to see the floor model and discovered it was date code 11A2. Needless to say I purchased it (after a quick test run using a power inverter) and as of this morning the magic jumper has been clipped and the unit is now operational in my vehicle. The moral of this story is that there is one more cellular capable scanner being used out there and until you tight-assed CTIA mother fuckers spend some hard cash on encryption more and more people will continue to listen to cellular phone calls.

4516. Re: I found a PRO-60 trick!

Newsgroup: rec.radio.scanner
Date: 1997-03-08 00:00:00 UTC
From: Charles Zingerline <zinger@spectra.net>
Message-ID: <3321FA10.2A2C@spectra.net>
Source record: 204792

I also had thought that the PRO-60 probably contained some other key-down/power-on tricks. The manual describes two (reset, and keychirp toggle), and other radios have similar things. I'd tried a few more but not the 1-Enter key one. Good catch, Paul!

The delay on the 1-Enter trick: I think this is when the 76 memories are loaded with frequencies, am/fm/wfm, etc., and the rest of the scanner is set up for the test.

I tried the trick and now have to reprogram the 76 memories -- not a surprise, though. Mine works as described.

One of the wfm frequencies, 98.0, is very close to 98.1, used by an fm station close to my home. The scanning started even while the PRO-60's display had all characters lit, because the scanner landed on 98.0 and stayed there, playing distorted music. Pressing a number, manual or pri cleared the display, and showed the 98.0.

I think there's some stuff to be found in the list. The fm/am/wfm pattern jumps out easily. Looking at the step size for the list, I see a pattern there too, although not so obvious. I also see the frequencies seem to hit edges and transitions, typical of testing.

Questions:

Why is #98 frequency 999.950 rather than 999.9875, like #28 and #64?

Why are there gaps (29-40, 65-80) in the memories used for this?

Why do the settings include abnormal settings, like 107.950 in am?

How would this scan pattern do anything for the manufacturer? How would it be used? And why? What kind of signals would have to come in on the antenna for this to be a meaningful test? How would the response of the scanner be measured?

The loading of the frequencies does not seem to affect whether a memory is locked-out. And locked-out memories are not scanned during the test. How can this be a valid test if some memories/frequencies are not used during the test?

I guess that this is probably a test scan used before assembly is complete, that the input is some sort of patterned frequency and mode coupled to the antenna, and that the output is taken from some internal test points. A good Pro-60 would have a predictable output based on predefined input.

While this is very interesting, I think the greatest value of this trick is to get more of us exploring various key-down/power-on possibilities of the Pro-60.

... Chuck

Hi, Glenn:

Love your big bands music :)

In regards to your post, this is not a stupid question at all. In
fact, we have discussed this from time to time on the news group.

I have a Pro-2006 connected to a Diamond discone in my attic and it
works fine. It is a pretty well-established fact that wood roofs do
not attenuate signals very much, so placing the antenna in your garage
rafters should be fine. The higher the better.

One of the factors that does affect signals using this configuration
are metal siding and metal roofing materials, as well as nearby large
metal objects such as, a/c units, etc.

If you live in an area that is covered by Scanner Master, you can look
up the frequencies in question and see if there are any PL tones used.
If you listen to a frequency where you receive more than one PD or FD
and want to listen to only one of them, then the PL board is for you
provided that their transmissions contain the PL tone. I have to have
it since my PD is on the same frequency as another town's PD which is only
20 miles away. If I don't use tone, I hear both.

This reminds me of the time I called the taxi dispatcher to ask him to stop cursing on the air. He started screaming and cursing at me on the phone because I had no right to be listening to their broadcasts. I find it useful to listen to the taxi dispatch so that I know when they are getting close to picking me up, thus helping them (and my neighbors - who won't have to hear the horn beep about six or seven times) because I'm outside waiting for them when they pull up.

When I bought mine, they told me to turn it off, unplug it, then
pull the cord out of the side of the unit. He said doing otherwise may
mess up the internal workings of the scanner. Since I paid a good chunk
of change for it, I have always followed his advice, and have never had
any problems.
Hope this helps.

4529. ScanStar SWG files AR8000

Newsgroup: rec.radio.scanner
Date: 1997-03-08 00:00:00 UTC
From: Harry Stuver <stuver@ix.netcom.com>
Message-ID: <33222A6E.618E@ix.netcom.com>
Source record: 204805

Just added the 1997 NASCAR Winston Cup drivers and officials
frequencies in ScanStar .SWG format for the AR8000 on my web site.

http://jsl.com/~stuver/ss_swg.html

I am also looking for others with ScanStar SWG files to add to my site.
Hopefully I can find some "redneck" frequencies in SWG format.
Just moved from Los Angeles to Norcross Ga.(northeast of Atlanta).

see ya all at the races.

Here's what I have to date:

I. FOR SURE - ON MY SCANNER
A. FIRE
460.600 CFD Dispatch
458.250 CFD Ch. 1
460.625 CFD (Ch. 3?)

B. POLICE
460.200 CPD - Dist. 1 (Central - Ch. 1)
460.425 CPD - Dist. 2 (East - Ch. 2)
460.100 CPD - Dist. 3 (West - Ch. 3)
460.275 CPD - Dist. 4 (North East - Ch. 4)
460.250 CPD - Dist. 5 (North West - Ch. 5)
460.325 CPD - Car to car (Ch. 8)

C. EMERGENCY
462.975 Univ. of Cinti. Hosp. Air Care Helicopter (Base only?)

II. ALMOST SURE - DO LISTEN OCCASIONALLY
A. FIRE
33.900 Hamilton Co.
33.940 Clermont Co.
154.190 Kenton Co. (KY)
154.430 Covington (KY)
158.760 Hamilton Co. Mutual Aid (Multi-Community use)
460.575 Norwood

B. POLICE
39.980 Clermont Co.
155.310 Fairfield
453.325 Kenton Co. (KY)
453.400 Kenton Co. - Car to car
453.500 Covington (KY)
453.575 Campbell Co. (KY)
453.700 Boone Co. (KY)
460.025 Hamilton Co. - East

460.050 Univ. of Cinti.
460.075 Norwood
460.125 Hamilton Co. - Jail
460.175 Hamilton Co. - West
460.300 Hamilton Co. - Car to car
460.500 County Wide Band for all agencies in Hamilton Co.

Take this crap to alt.dorks or private e-mail. It has nothing
whatsoever to do with scanning and we resent having to waste our time
sifting through nonsense like this.

You could make your own wire dipole that you could tack on the walls.
It would only be 10 feet long at the most and you could add several
bands. Plus you could roll it up and take it with you. I've made one
and it works well for just your problem of not being able to mount
anything outside.

4535. Mobile antenna opinions

Newsgroup: rec.radio.scanner
Date: 1997-03-08 00:00:00 UTC
From: Eric <ec222@iscweb.com>
Message-ID: <332200B9.6B5F@iscweb.com>
Source record: 204811

Hi there! I'm seeking opinions on mobile scanner antennas. I'm having a 3/8" 24tpi mount made for the place where my stock car radio antenna goes. I plan to run some good coax to a spliter where one lead will go to my car radio and the other to my scanner. I'm looking for something that works well on all bands, especially my favorite where I am VHF-lo. Has anyone tried the one from Grove? Or the ones in EEB's catalog or from Scanner World? I'm sure they all work great on most of the bands, VHF-lo is my main concern. I tried the glass mount antenna and it was terrible! Thanks for any help!

Looking for Bearcat Crystals suitable for Bearcat III, IV crystal controlled scanners. Please advise me as to which frequencies you have and how much are you aking per crystal or whatever number you may have. I am located in New Haven, Connecticut. Some of the frequencies that I am looking for include, but are not limited to: 453.200; 460.100; 460.150; 460.200; 460.275; 460.375; 460.400; 460.450; 460.475; 460.500; 460.525; 45.86; 42.48; 154.025; 154.01; 154.31; 153.77; etc. ad nauseam.

Thank you anticipation of you reply and, hopefully our being able to "strike a deal".

The CB freqs. start at 26.965 and go to 27.405 (these are the freqs.
originally allotted to CB.) Many CB'er operate outside these.

4543. NetSet PRO2029 Band coverage shock!

Newsgroup: rec.radio.scanner
Date: 1997-03-08 00:00:00 UTC
From: alan.titchmarsh@bbc.co.uk
Message-ID: <33209afb.0@hades.ndirect.co.uk>
Source record: 204846

Hey all

I bought an end-of-line NetSet Pro2029 from my local Tandy here in the UK. The assitants said it had been hanging around for ages and let it go really cheap. I wanted it as a backup to my AOR1500.

Anyway, the assistants had only a photocopy of the manual, but it showed band coverage to be:

30 - 50
50 - 54
118 - 136
138 - 144
144 - 148
148 - 174
380 - 450
450 - 470
470 - 512

Fine, except that try entering a frequency in the first two bands and you get nothing but error messages.

After lots of exploring I've found that coverage is as above with the exception of 68 - 88 in place of 30 - 50 and 50 -54.

Is it possible to access the lower freqs? Has the scanner been changed for the UK market or was it released in several formats and perhaps I have the wrong manual?

Your help would be much appreciated.

Thanks
Al

4544. Channel Master 5094A vs. Grove Scantenna

Newsgroup: rec.radio.scanner
Date: 1997-03-08 00:00:00 UTC
From: fbals@aol.com
Message-ID: <19970308005801.TAA12865@ladder01.news.aol.com>

I am looking for a good tabletop scanner. I want one that can be modified to pick up 800 MHz cell phones, or one that has already been modified. This is going to be a gift for my Dad.

If you have one you can e-mail me at: aaycock@ipass.net
Or you can send me e-mail at: kd4cht@juno.com

Thanks,

Alan, KD4CHT

4548. New Scanner Listening Mailing List!

Newsgroup: rec.radio.scanner
Date: 1997-03-08 00:00:00 UTC
From: jpoulin@shell.taima.on.ca
Message-ID: <5fqv5c$3hd@news.istar.ca>
Source record: 204851

I would like to inform all Scanner Listening, Shortwave, Ham, Amature radio users and listeners, of a new mailing list in the Ottawa-Hull region, that caters to our region!

Finally a mailing list that Ottawa area scanner listening enthusiasts can take part in to exchange ideas, discuss Scanners, Antenna designs, as well as, Shortwave and Ham chit chat.

If you are interested in joining the list, simply follow these instructions ...

Send am email message to majordomo@shell.taima.on.ca and in the body of your message type in the follwoing.

subscribe ott-scan your@email.address

You will be sent back a message with an authorization code. You will be required to send the auth code back, in order to be added to the list. (This is to filter out unwarranted subscriptions).

You will be validated right away, and added to the mailing list.

My ott-scan mailing list listings are closed off to the public for your piece of mind. This way people cannot see who is on the list. This way, your email address will not be given out.

If you have any questions, please feel free to contact me.

Hope to see you on the list!

Have Fun, and Happing Listening!

James Poulin
Ottawa, Ontario Canada.

I found a good book on EMI and RFIat the library ..title is ZZAP, taming EMI, RFI, and ESD

to mminimize the RFI from mu computer, I bought sheet metal and affixed it to the inside of the computer case. Al foil will work also. Since yur modem wires are not shielded (most RJ-11 phone cords aren't) this can act as an antenna conducting hte computer generated noise to the outside and radiating it so it interferes with our scanner. I seem to get the most interferance on AM frequencies (Aircraft 118-136 and 225-400) though I do get interferane elsewhere when I am sorting or indexing a databse.

>
> First things first, throw the ruddy antenna
> and get a good one! The one
> that comes with it is quite good compared > to the one that came with an R1, > but ruddy useless.

Quite agree....totally useless...

The most annoying thing that i have found is the fact of it "selecting" its own tuning steps...

e.g. One of the Cellular bands in UK starts at 935.0125 Mhz, and steps in 25 Khz steps. If you start at the above, and tune in 25Khz steps ie, on channel, the radio automatically "corrects " the offset....

BAAAA........Then again it is not a scanner

> quite keen to try an MVT9000, yet with a
> price of nearly $1300 for-bloody-get
> it!

The AOR/MVT can be had, in the UK, for £439, inc tax....What is the exchange rate today? Even at 2:1, still less than $900.

Major drawback in a lot of cases, no computer interface....

Look forward to any other comments you may have.....
Andy..

>I'm deciding to buy and Icom Radio. Could anyone explain
>the differences between the 7100 and the new 8500.

The R8500 has much wider freq coverage -- down to 100 kHz.
The R8500 I tested has better sensitivity above 1,000 MHz, though
it receives images there. I measured the 12 dB SINAD sensitivity
using the EIA RS204-A standard procedure and plotted it to 2,000 MHz.
The graph appears in my MT review.

Both receivers have different memory bank arrangements:
The R7100A has fixed banks of 100 channels each, and the R8500 has
user adjustable bank sizes. Each memory channel in the R7100 can
have what I call a "sub-bank" number associated with it (0-9).

The R8500 scans and searches much faster than the R7100A.
The R8500 supports programmable alpha labels for the memory channels
and banks. It has more tuning step sizes, including a handy
programmable step size.

The R7100 has a CI-V computer interface jack, but the
R8500 has both a real DB25 RS232 and CI-V computer interface jacks.
The R8100 has a jack on the back which taps into the AGC or
baseband audio, depending on the setting of an internal jumper.

The R8500's audio peak filter has 2 bandwidths and adjustable
center frequency. I use it as a "tone control" on FM.

Physically, the R8500 is built much better, using a massively
cast metal chassis with internal partitions. It has better
shielding and is much heavier. The robust construction may account
for most of the price difference.

The R8500 is much larger than the R7100 and the front panel
controls are easier to operate since they are bigger and further apart.
The R8500 keypad employs soft rubber keys versus the hard plastic
R7100 keys. The smaller R7100 is handier for placing
on a car seat and driving around while looking for noisy
power line insulators, etc.

These are just some of the differences. See my R8500 review in
January 1997 Monitoring Times magazine for quantitative test results.

I sold my ICOM R7100A after buying an R8500 but both
are great receivers. I would have kept both if I didn't

have to work for a living :-)

>scanners to foreign countries? Any trouble customs? Is it worth
>taking it?

Hello Jim,

I travel to our office in India (where we do a lot of commo work), and carry equipment with me.

India is a difficult country if you must pass through customs. If you have a sweetheart you can go around Customs.

Customs clearance and getting your luggage takes a *long* time. You will be in line for hours if you enter through Delhi. FWIW, make sure to pee on the plane just before landing as it may be several millennia before you can get to a potty without giving up your place in line.

Take your own toilet paper. It is scarce there. They do not use it.

I would not try to take commo into India unless you had a friend on the other side. Customs x-rays all luggage. If yours comes out on the table with a chalk X on it, be prepared for a long ordeal.

Fortunately, Indian Customs is one of our customers. And we pay someone in advance to get us around Customs.

Radio equipment is heavily regulated in India. Anything you are bringing well could be confiscated and held for ransom. This may be only the decision of one local nobody clerk, but the others will all back him up.

They also can and will confiscate batteries. One of the nicest gifts you can bring to someone in India are quality alkaline batteries if you can get them in. Indian-manufactured batteries are expensive and extremely poor quality. AA and 9 volt most in demand. A hundred bucks worth of batteries could finance a week in India in a 4 star.

A hundred rupees will solve many problems with officials. (approx 30 rupees to one USD). Just offer to "cover expenses", or to "pay you for yuor trouble". Be *very* patient. They are very laid back, and nothing happens in a hurry. Do not pay the first figure mentioned. They like to negotiate for every little thing, and you can settle for 1/3 to 1/2 of the starting price.

Do not drink *any* water unless from a bottle with the seal broken in your presence. Carry a bottle of water with you. A common scam is for them to refill bottled water bottles from the polluted tap and resell it. Even in restaurants, you must see them break a seal. See your doctor and stary prophylactic malaria pills several weeks before you leave and maintain for several weeks after your return. These are very real problems, especially starting this time of year.

You really need an Indian national on your side, to meet you and walk you through everything.

Be careful taking any rupees out of India. They are very tight on that, and anything they find on your person if they search you when you leave will be your fine. OK in your luggage.

Even in Delhi there's not a lot on the air. Department of Revenue Enhancement is one of the more active law enforcement agencies, and they operate on VHF. The police use antique Motorola handhelds circa 1960's - 1970's also on VHF. Although they speak a form of English I have a very hard time understanding them.

Don't forget chargers. India is 220 volt with the 2 round pin plug. A cheap converter will work. Power is iffy, up and down without notice, sometimes for hours, even in 4 star hotels. Charge/shave when you can.

Monsoon season starts right about now, till late fall our time. I would not be there after the beginning of March. Literally 90-110 degrees F, at 95% humidity. If you haven't experienced this you are in for a treat. You will learn the places in town which have air conditioning.

Enjoy your trip. India is a lovely country, with beautiful and gentle people mostly.

Listening to cellular calls with "imaging" is easy and no mods are
required. I've forgottne how much "above or below" freqs should be used to
convert. I've read 21.4 above the listed frequency but then someone else
said "below".
Yes, I could fiddle around and probably find out but I thought someone
might know whether one adds the number (21.4?) or subtracts it from the
real frequency.

>>I love hearing cops defend the absurdly low speed limits which they never
seem to follow. Without fail, whenever I see a cop he or she is
travelling 15-20mph over the limit. Don't give me the typical bullshit
answer that cops "are trained" to drive well above the speed limit. I
don't know of too many agencies that send their officers to high
performance driving schools such as Bondurant, Skip Barber, etc.<<

Maybe he's going to your Momma's house and save her ass 'cause one of her Johns didn't pay up...

>>Remember 25 years ago when states had speed limits of 75mph and above.
This at a time when cars had skinny bias ply tires, drum brakes, and
suspensions that couldn't handle for shit. Now that cars have high
performance tires, excellent brakes and suspension systems, there is
absolutely no reason why speed limits shouldn't be 75MPH or higher.<<

Let's make it 100 MPH on all 2 lane roads so you can go 130....

<< Any cop that tells you speed enforcement isn't for revenue
enhancement, is
lying his ass off. If departments are that hard up for cash, why not ask
the legislature for more funds. This way cops could get back to dealing
with real crime, not wasting their time on people driving 11MPH over what
is an artificially low limit in the first place. So yes, I would highly
recommend getting a detector or whatever else evens out the playing
field.<<

Yeah, yeah, yeah.... Same old stuff....

>> Also make it a point to fight every ticket in court. Make the cop work
for your money!<<

They LOVE that! Time and a half, you see......

>>Just my $.03<<

and that was about what it was worth. FLAME AWAY!!!!!!!!

The idea behind a laser detector is that if someone else close by gets
lasered, your detector will pick it up. However, that means that the
useful range of such a detector is only a hundred feet or so. Still,
that's better than nothing.

>Dear Sir -
>I'm not sure how you define a "power happy pig," but the last time I
>checked, the proper title was Law Enforcement Officer. Now, sir, it would
>appear to me that you were, in fact, BREAKING THE LAW!

When the government starts setting _reasonable_ speed limits and stops using "law enforcement" as an undeclared tax on driving, THEN I'll start following the speed limit. However, I refuse to believe that a 55mph limit is actually designed to protect me from killing myself.

I have never had an accident. I have also averaged two speeding violations a year since I got my drivers licence. Despite having more driver training than 99.9% of the drivers on the road, almost every time I have been pulled over, the cop screamed at me as though I was a serial killer, when in fact, he was driving faster than I was. While I have the utmost respect for police when they are truly protecting me, I have absolutely no repsect for the bored pig sitting in the median, waiting to nab the unfortunate grandma that accidently hits 59mph.

The United States is the most advanced country in the world, yet we (especially you guys in New Jersey) persist with an archaic infrastrcuture that mindlessly clings to laws that were written with 1972 American cars in mind (i.e. the 55mph limit). It's about time you got off your power trip and realized the backwards thinking that your ideas represent.

Sean Aron

4578. listening to deer!

Newsgroup: rec.radio.scanner
Date: 1997-03-09 00:00:00 UTC
From: Jeff Singer <k0od@ix.netcom.com>
Message-ID: <3322C840.432E@ix.netcom.com>
Source record: 204633

The Missour Department of Conservation has put tiny radio transmitters on more than 100 deer near my home. This is a project to track the habits of "urban deer." The conservation people have several trucks each equipped with a 4 element hand-rotated Yagi very roughly the size of one for the 2-meter ham band (144-148 mHz). My kids would like to track the many deer that cross our land for a science fair project.

The conservation people have refused to tell me what frequencies they are using. Using my scanner, I've yet to hear anything on FM or AM that sounds like deer telemetry (whatever that sounds like!). I've tuned the range from 140-180 MHz many times.

Questions: 1) What frequency and mode might these small transmitters be using and what would they sound like. 2) How are the conservation people able to ID and follow each of the 100+ deer. Is each critter on his own unique frequency or have his own "call letters?" 3) Is it likely the deer do not transmit continuously to save battery power.

The kids and I would sure appreciate any help.

Jeff amateur radio: K0OD St Louis MO

They have already done this......there called V-link phones.
Walmart and other stores sell them for around 60 to 80 bucks each
Nice little boogers but the range sucks....about a half a mile in most
cases 1,000 feet is what they claim.

My Scanner site (Tom's Scanner Site) is at
http://www.geocities.com/CapeCanaveral/9530/ for anyone who didn't know
about it.

Some of you know that I have been trying to start a National Scanner
Frequency Database. I have been able to allocate space for a National
Frequency Database, but CGI scripts just won't cooperate with me, so for
now, I am manually adding frequencies to a page. I would appreciate if
you would submit your FAVORITE frequencies (limit to 5 for now) at this
new site. You can get to it through the geocities site mentioned above,
or just go directly to it at: http://archimedes.galilei.com/tskill/

If anyone has experience with CGI Scripts and using them on an Apache
Web Server, Please Email me at: tom@bbs.galilei.com RIGHT AWAY!

Thanks,
Tom Skillman

> 'cause I really like the program.
>
> Input is from the Line-Out jack on my PRO-2042 to the Line-In input of
> my SB16.

There are a few possibilities :

1) Since you are working with the Line-In port, you have un-amplified input. If the Test tones work (On the tuning page) then you have an input volume or threshold problem. Try plugging the scanner into the Microphone port (Which is amplified) - Your results should be better. Also, Make sure that the recording volume in the windows mixer is turned to its highest, and that recording controls are turned up. My bet is that if you tries to record with Windows Sound Recorder, The tones would be VERY quiet.

2) Your threshold may just be set too high. If you do everything in #1, and still have problems, then lower the threshold setting - That is also on the tuning tab.

In my experience, it is the fact that you are using un-amlified input, and the tones simply are not loud enough. Let me know if this does not work.

Does anyone know the states that have laws prohibing the use of mobile
scanners in your car?
And is it also true that some states exclude this law for lic.ham
radio operators...is it legal
for hams to use scanners in all states.?
please reply.

4592. VFOs

Newsgroup: rec.radio.scanner
Date: 1997-03-09 00:00:00 UTC
From: Eric Gillett <erg@kotr.com>
Message-ID: <3323A294.3C77@kotr.com>
Source record: 204647

I've seen some scanners listed with VFO (variable frequency oscillator). Some upper end scanners like the AR8000 and Yupiteru MVT9000 have dual VFOs.

As someone looking to buy a new scanner, could someone please explain how I would use a VFO and what it is.

Also, what is the advantage of having twin VFOs. Is this worth the extra money/capability? How is two more advantageous than one.

Thanks in advance for your reply.

Eric

4593. Yupiteru vs AOR

Newsgroup: rec.radio.scanner
Date: 1997-03-09 00:00:00 UTC
From: Eric Gillett <erg@kotr.com>
Message-ID: <3323A457.C3F@kotr.com>
Source record: 204648

Two upper end scanners that I have been looking at are the Yupiteru MVT9000 and the AR8000. They seem to have very similar characteristics with the biggest one being that the AOR can be interfaced to a PC while the Yupitero cannot.

I am looking at buying a new scanner in the new future since the technology has changed a lot since buying my Realistic PRO-2020 about 14 years ago! Its held up excellently, by the way. What are the advantages of being able to connect a scanner to a PC? I currently have a Pentium 150Mhz PC, so I could take advantage of this. What does PC scanner software allow me to do that I couldn't do with my scanner alone?

Also, the Yupiteru's frequency range extends to over 2Ghz. I've heard that there is not much to listen to above 1Ghz. Is this correct? What type of transmissions use greater than 1Ghz?

Thanks so much for your reply.

Eric

For the RSU# (Radio Shack Unlimited part no.) go to
http://support.tandy.com/support_electronics/2849.html. Then call
1-800-THE-SHACK. Compared to going into a RS store, the mail order
does a very good job about knowing what you are needing and will
get it to you in a reasonable amount of time.

4595. Re: i need info for decoder for alphanumeric

Newsgroup: rec.radio.scanner

Source record: 204650

I am using the Universal M-450 and an ICOM R-8500 with excellent results. I recommend changing the strap option for the AGC OUT jack to provide discriminator output. This is the raw audio signal out of the FM demodulator before it's amplified. This eliminates problems with the audio amp clipping and distorting the signal. I could receive some stuff off the REC OUT jack, but not as well as with discriminator output. RTFM for details on how to do this on the R-8500.

Try modifying your radio to provide this output. I know it's simple to do on most newer radios. Check the mods websites. Also, there are two other modes in common use besides raw POCSAG, there is also Super POCSAG and POCSAG24. Make sure you are trying to receive the right mode.

Flex(tm) is proprietary to Motorola. Given their recent licensing of their trunking technology to Uniden, I would imagine they will do the same thing for the Flex(tm) format. Give Universal some time and it'll be available as well. The other formats are not going to go away any time soon given the very large installed base and the fact that paging services are charging a premium for Flex(tm) pagers.

Mike Harpe, N4PLE
Jeffersonville, IN

Trademarks are properties of their respective owners. Batteries not included. Your results may vary.

Hi there, I just installed one in my pro-2006. I am very happy with it. What you do is get ahold of one of the scanning software packeages made for the opto board, connect it to a serial port, set up the config on the program (port, baud rate, (board defaults at 9600) etc.).When everythings set up start your scanner, then the program (I use Radio Manager currently). When the prgram comes up, the display on the scanner should go blank. The scanner is now controlled by the program.

I currently monitor the CB channels with my AR8000 while traveling.

My question is this;

Would a handheld CB, such as a Cherokee AH-27, provide better receive range then my AR8000? It's my understanding that a handheld CB suffers on the transmit end, but not sure about receiving. I use a mag-mount CB antenna from RS.

It seems that the AR8000 will only receive CB traffic that is almost in visual range.

BA277 (Speedbird 277) routes London Gatwick - Phoenix - San Diego. I'm not
100% on the current flight times but it used to be:-

Dep LGW 12:00
Arr PHX 14:35
Arr SAN 16:40

It is a DC10 service.

Hope that clears the mystery.

Source record: 204677

****Uniden Bearcat BC9000XLT Tricks****

Info from Dave Rodriguez (Uniden Corp) & Jeff Zeman (73252,3645).
Additional info from Bob Parnass (Monitoring Times).
File written by SYSOP*Jeff Goldman WA1UDB.
By holding down the 2, 9 & DLY keys as you turn the 9000XLT on,
you enter a sort of Test Mode. To do a "keycheck test" you can hit
any key or turn the VFO knob either direction and the alpha display
will tell you what key you're touching or which direction you're turning
the VFO knob.
At this point, if you momentarily hit LOCK (to the right of the VFO
knob)
and one other button various things will happen:
LOCK & C - REPLACES ALL MEMORIES w/1300MHz and alpha-tags
channels 1-250 with CH 00-249 in the display. Wipes out your memories!
LOCK & D - Checksum and Firmware Version Number
LOCK & E - LCD Display Test
LOCK & PROG - Runs a short, continously-repeating Demo Program
incorporated specifically for showing at the Jan 1995 CES in Las Vegas.
It also sounds attention tones as the message scrolls on the display!
(Note that the word "scanner" is spelled "Scaner" in the demo program;
it was too late to change this booboo that originated in Japan.)
The last three tricks will NOT wipe out memory. Only LOCK/C will do
that.
The Uniden Sales Dept allegedly requested that cellular images be
included in the BC9000XLT (since it's legal to do that). The front end was
left wide open to allow this in the 360-385MHz range.
No reason available on why the FM filtering is narrower (ie less HiFi)
than on the BC8500XLT. It was done in Japan without explanation.
The audio amp doesn't shut off as in the BC8500XLT during quiet
periods.
There was an improvement in the circuit, but this means a bit of hiss when
no transmissions are coming through.
All BC9000XLTs (whether built in 1994 - serial numbers 45+ - or in 1995
- serial numbers 55+) have firmware version 0.09. And all have AM mode
available on any frequency the scanner is capable of.
The BC9000XLT is capable of having an alpha tag attached to any
channel, but 250 tags is the limit. (This was verified by doing the
LOCK/C trick. The scanner loads 250 tags and shows a memory
full warning if you try to enter additional tags.)
You can use the SND button during a Search as a sort of
Radio Shack-type MON button, transferring a freq to any bank you'd
like to become your "Monitor" bank. With RS scanners, you have
to go through extra steps to transfer the memories from Monitor

channels to permanent channels.

>newer model pro-51??

> -T.J.

It will still program a bunch of test freq. but channel 23 will not have the 888.0000 freq and you will not be able to search in the 30mhz steps.... So basicly you won't get the cellular...You'll get good images though in around 865mghz up to 915mghz. The newer pro 46 had a daughter board put in by the factory....and can be modified, does anyone know if the same is true for the Pro 51???
Please respond....
M.C.

These frequncies may be valid for Australia, but not the US.

The Cordless Phone/Baby Monitor freq's here are more in the 43-49MHz
Range.

Check out this URL for Freq listings:

Steve,

Aero HF frequencies are listed in the FCC rule book. At a good public reference library look in the CFR (Code of Federal Regulations) Title 47 (The FCC's) rules and specifically, Part 87 (Aviation services) specifically section 87.263.

As for maps indicating waypoints I've obtained a map covering the entire North Pacific showing all routes with waypoints listed. This map is published for the FAA by NOAA and is titled "North Pacific Route Chart Composite". I purchased it at the San Jose Jet Center for about $6. I believe that NOAA has a 800 number for telephone orders if you have no chart distributor in your area.

Regards

Ed

This is a multi-part message in MIME format.

Lets try that again... It's too early!

Those freqs might be valid in Australia but not the US.

Try this scanner frequncy reference:

Shore stations are 4.600 MHz above the ship frequency. In U.S. waters the shore frequency may be used on Channels 20, 24-28 & 84-87. Channels 1-5 & 60-64 are shared with other services.
Channels 75 & 76 are reserved as guard bands for ch 16.

Specific assignments include:

06 (156.300) - Intership Safety

13 (156.650) - Weather, notices, etc.

16 (156.800) - General Calling

22 (157.100) - Coast Guard Liaison

I agree! There are to many folks out there that don't want us to hear
their illegal activities going on. I love the chance to report a drug
deal going down or a cheating husband/wife (mostly cops). When I hear
something illegal, I get all the info I need and go to the local
payphones to call it in......I explain the situation (in less than a
minute) and leave.
I know that I have caused a few divorces, four drug deals gone bad, and
six drunk drivers to spend a night in jail....all from listening to cell
calls! Now whats so damn bad about that. I fell I am doing the right
thing. I haven't ever used it for personal gain....well, I guess I have
gained personal satisfaction!

4619. Re: Wireline / Non Wireline ?

Newsgroup: rec.radio.scanner
Date: 1997-03-09 00:00:00 UTC
From: radman7734@aol.com
Message-ID: <19970309190401.OAA01497@ladder01.news.aol.com>
Source record: 204686

THIS ANSWER COULD BE WRONG BUT THIS IS WHAT I HAVE GATHERED. WHEN A CELL SYSTEM IS INSTALLED TWO LICENSES ARE ISSUED BY FCC. ONE TO AN ESTABLISHED TELEPHONE COMPANY (LIKE BELL SOUTH,AKA MA BELL) WHICH IS A WIRELINE SYSTEM (OWNS THE WIRE IN GROUND AND POLE SYSTEM) AND THE OTHER TO A PRIVATE COMPANY SUCH AS CELLULAR ONE WHICH IS THE NON-WIRELINE SYSTEM (RENTS USAGE OF HARDWIRE SYSTEM FROM MA BELL). THE LICENSE ALLOWS THE VENDORS TO OPERATE ON A TEN MHZ/MC WIDE BAND. NON-WIRE CHANNELS START AT 870 MHZ AND WIRELINE STARTS AT 880.020 MHZ. MORE CHANNELS HAVE BEEN ALOTED SINCE I ASKED ABOUT IT AND AS OF RIGHT NOW I BELIEVE IT STARTS AT 869 AND ENDS SOMEWHERE AROUND 894. HOPE THIS HELPS.

4620. Re: BC-9000XLT keypad tricks?

Keypad Tricks for the BC-8500XLT Scanner.

Hold the 2, 9, & SCAN keys while turning on the power loads test
frequencies into the following channels.

CH Frequency in MHz
-- ----------------
1 25.0150
2 27.0950
3 54.0500
4 111.0875
5 112.0125
6 224.0950
7 299.0125
8 300.0875
9 418.0125
10 419.0875
11 549.0500
12 760.0125
13 916.0875
14 917.0125
15 1119.0875
16 1120.0125
17 1223.0875
18 1224.0125
19 1229.0875
26 25.5000
27 27.0650
28 40.8400
29 62.4500
30 73.4500
31 87.4500
32 127.1750
33 162.4000
34 195.5000
35 220.5000
36 230.0500
37 325.0500
38 453.2500
39 531.5000
40 765.2500
41 954.9125
42 1085.7500
43 1120.1250
44 1205.8750

45 1299.9125

* So far I cannot find any out of band frequencies but if someone found one such as 888.960, you could unblock the 869 to 894 MHz part of the band. Other Uniden made scanners (PRO-23, PRO-46, PRO-51) can restore this part of the band by this trick. Some of these use several key combo's to load different freq's like 2, 9, & MANUAL loads one type of test frequencies and 2, 9, & LOCKOUT loads different ones such as the PRO23. The KEY seems to be that all key combo's start with a 2 & 9 with one other key held while power turned on. This holds true on most Uniden made scanners like the above including the 3000XLT & 9000XLT.

Hold 2, 9, & CTCSS while turning power on - counts from channel 1 to 25 Bank (A) very slowly in Demo Mode and displays the following message:

"Uniden America Presents You A New Bearcat BC8500XLT Specifically Designed For Professional Scanner User. Features Such As 500 Channel, Continuous Band Scanner V.F.O. Control, 20 Banks, 25MHz to 1.3GHz, Turbo Scan, 10 Priority Chs, Auto-Store, Aux.Tape Output, Alphanumeric LCD display. Great Stuff!! For Example DPS Dallas Texas HWY Patrol"

* This message is displayed over and over. This will only work if you first Hold the 2, 9 & Scan keys while turning on the scanner and then turn it off. Finally Hold the 2, 9 & CTCSS keys and turn on the scanner. I guess this was used to demonstrate the scanner at the CES.

Hold 2, 9, & PROG while turning power on - Display goes blank and can hear background noise/static like listing to an channel with the squelch open while channel not active. (Not sure what it's for, maybe a test mode or a Program mode. Very Strange). Any ideas?

Hold 2, 9, & MANUEL while turning power on to clear all channels to 000.0000 MHz. You can use this like a system reset to clear ALL memories.

There maybe other keypad tricks but this is all I found so far. Don't you love the Uniden programmers. I'm looking for the game thats been rumored to be hiddened in it's firmware. I'll find the secrete key tricks someday unless someone beats me to it.

If you know anyother keypad tricks for the BC8500XLT please E-mail me.

Thanks, Carl.

Hi,

I've lost the manual for my AR8000, and I've forgotten how to adjust the Scan and Search delays and the Audio Scan function, which I'd like to disable. Anyone have any ideas?

Incidentally(this will probably only apply in Europe),I bought my 8000 after reading that the wandering birdies problem had been solved on the new CE badged versions and that it was RF shielded. Well, I got mine from Nevada in Portsmouth about one month ago, and it certainly still has both problems. I read somewhere that the wandering birdie could be identified by a slight tone that appears on pressing the 'monitor' button; if thats the case, they are there, and certainly make searches less useful. Also, I have noticed that the 8000 is not as sensitive as my old Yupiteru MVT7000, in a side by side comparison, though the computer control and extra functions make the 8000 well ahead IMO. I know Yupiteru make superb receivers, and I would have bought the new MVT9000, but omitting the RS232 interface was unforgiveable. I'm not interested in elaborate and expensive software with spectrum display and database functions; for me the really useful thing is to be able to save and upload Scan/Search banks at will, and editing them with a WP, rather than the scanner keyboard.

Final question: I've never heard anything in the Mil Air band on either set, though I know that airfields are thin on the ground in North London, where I live. Are there any frequencies I should be checking, or is this to be expected at my location?

Thanks,

Joe

>- CrACKeD

Hello,
It is always a good thing to isolate the tap from the receiver. It
would be a good thing to use a small cap (say .001 or .01Mfd). I am
going to add taps/outputs for baseband and IF on my PRO-2005 soon and
do not want to cause any damage to the receiver. The audio/RF signal
(AC) will pass through a cap so this would probably be best. As to
loading down the circuit, I do'nt know. Hopefully someone else with
some more info will answer this post and set us on the straight track.

Best Reguards,
Jerry

Probably because they do not feel there is enough demand for this route.

The BA LGW-PHX flight continues on to San Diego. The return is
SAN-PHX-LGW as well.

Hello,

I have an AR8000 with CU8232 computer interface with manuals for sale, $350.The radio has had the cell mod performed and the wide/narrow filter switch installed. If you haven't heard one with the switch mod you are missing a major improvement in capability. The radio functions perfectly. The numbers have started to fade but are readable, before they got real bad I coated them with clear nail polish. The case shows wear and scratches. I cut a slot in the battery compartment door for the interface cable so you do not have to remove the cover to connect the interface cable for programing.

$350 shipped in the lower 48 UPS. Cashiers check or postal money order only. No trades.

Uniden BCT-7 $100. Like new, with box & manual, shipped in the lower 48 UPS. Cashiers check or postal money order only. No trades. This unit receives image cellular quite well.

Email k8wx@infinet.com

I have a Bearcat BC 100 XLT for sdale. I just recently bought it
used, and I didn't get instructions and simply don't know anything
about it, or scanners at all. I was told it picks up Cellular, but I
can't figure it out. I'd rather sell it and forget it.
Comes with leather carrying case, charger/ac adapter, rubber
antenna. $100 shipped COD

What is an illegally modified scanner? My read of the law requires
that it not only have cellular frequencies enabled, but all other
frequencies disabled in order for it to be clearly illegal.

"Primarily for the use of..."

Does the law say "receive" or "listen"?

It says "capable of receiving" WRT the manufacture of scanners, but
not with regard to reception... according to the way I read it. IANAL

Dunno if the "tracking" exemption specifically exempts triangulating
on a cell call, but the rest of the definitions APPEAR (IANAL, and I
haven't carefully looked at the full text) to only cover the CONTENTS
of the communication and not the existence of such.

2510. Definitions
As used in this chapter -
* (4) ''intercept'' means the aural or other acquisition of the
contents of any wire, electronic, or oral communication through
the use of any electronic, mechanical, or other device.
* (8) ''contents'', when used with respect to any wire, oral, or
electronic communication, includes any information concerning the
substance, purport, or meaning of that communication;
* (12) ''electronic communication'' means any transfer of signs,
signals, writing, images, sounds, data, or intelligence of any
nature transmitted in whole or in part by a wire, radio,
electromagnetic, photoelectronic or photooptical system that
affects interstate or foreign commerce, but does not include -
+ (D) any communication from a tracking device (as defined in
section 3117 of this title);

2511. Interception and disclosure of wire, oral, or electronic
communications prohibited
* (1) Except as otherwise specifically provided in this chapter any
person who -
+ (a) intentionally intercepts, endeavors to intercept, or
^^^^^^^^^^
procures any other person to intercept or endeavor to
intercept, any wire, oral, or electronic communication;
[...]
+ (c) intentionally discloses, or endeavors to disclose, to any

I don't know. It was one of the possibilities when I went into RS last week. When I found out the Pro-60 received military frequencys and now fit in my $ 200.00 budget, I bought the Pro-60. I have been pretty please with it overall. It does eat batteries pretty fast. I bought some AA nickel cadmium batteries to make use of the charging circuit. Some have commented on it's low sensitivity, but running it side by side with my RS Pro-2005 it gets most or all of the same transmissions. I live about thirty miles from two different good sized towns in a fairly rural environment. Only strong signals from those towns make it this far. Probably from repeater towers. My thoughts, for what it's worth.

If you see a police officer exceeding speed limit without lights/siren,
take down car # or license plate info and call the department ask for
supervisor and report it. The Police DO NOT make the speed limits. As for
revenue enhancement can you think of another way to keep people from
speeding other than by hitting their pocket book? I would love to know &
would be all for it.

As with most of the most recent RS (mfr by Uniden & GRE) and Unidens own sets the frequency "coverage" is controlled by the main IC rather than a Matrix of Diodes or similar as on some earlier sets and it isn't possible to restore those frequencies used by US Cellular..

The US PRO-60 uses a CPU that has the US cell frequencies blocked out, the version sold here in the UK and elswehere in Europe uses a different CPU (the only different component between the two "models") that does not have the frequencies used by US cellular blocked out.

The only way to restore the frequencies used by US Cellular and allow keyboard entry is replace the main IC (a 100 pin'ish surface mount chip). The PRO-60 however does not have programmable increment steps and you would find if you did replace the IC then it would step through the 800MHz frequencies in 12.5KHz increments. US cellular uses 30KHz.

Hope this helps.

Paul I readin some journal that RS had a bad soldering machine on one of it's production runs and a lot of scanners have the same problem as you do. Probably a cold solder joint in the power supply section somewhere. If you can solder at all try doing some touch up soldering around the power supply. Or find a tech who can do this for you or ask RS to fix it. Should not cost that much. The salesman at your RS store probably does not know about the bad soldering machine used on the production run of which your scanner was one. Good luck

4649. QUESTION: CELL PHONE MODS FOR OTHER USES???

Newsgroup: rec.radio.scanner
Date: 1997-03-09 00:00:00 UTC
From: "Phil G." <internet.usinet.pgrund@ibm.net>
Message-ID: <01bc2ce2$bd223d20$44a348a6@nic1.barrnet.net>
Source record: 204716

Does anyone have information of modifying cell phones for ham bands or for other use such as full duplex simplex use as personal communication devises...
for short range???

I sincerely believe that there is a niche in the market for such a modification because of the cheap abundance of the mobile and portable cell phones.

If your an engineer or technician reading this ... how'd bout pondering the idea...

Give me a response to my questions whoever or whatever positive or negative.

Thanks...

1) Percon has a database on the WEB at
http://www.perconcorp.com/db_srch.htm

2) The FCC now posts their database at
http://www.fcc.gov/wtb/databases.html. You can use SW from Scanware to
read these unless you are up to writing your own SW to access a Sybase
database. You can find Scanware at http://www.wvsc.wvnet.edu:80/~fcc/

Last year I picked up the following from this site. Don't know if
they're still good. Now that I've ordered a TrunkTracker, maybe someone
will verify them. Anyway :

1-866.1125
2-866.1375
3-866.3500
4-866.3750
5-866.4375
6-866.6375
7-866.7500
8-866.8125
9-866.8375
10-867.1000
11-867.1625
12-867.3500
13-867.4125
14-867.4375
15-867.6250
16-867.6875
17-867.8375
18-867.9375
19-868.1375
20-868.2375
21-868.2875
22-868.4375
23-868.5375
24-868.6125
25-868.7375
26-868.9375
27-868.9525

Hello!

I recently purchased a scanner off the net from a really nice guy! A Uniden Sportscat! The only problem was that he couldn't find the book with all the sports frequencies and said that if I post a message here that someone might know a URL where I can find them. I would really appriciate if someone could get back to me if they have any information on this.

Thanks,
Eric D.

The current issue of Car and Driver has an article on that very
issue. I have the Bel that came in second, and while it has great
range and is very easy to use, it falses quite frequently.
Also, when you decide which one to buy, the catalog retailers (i.e.
SBH, etc.) in the back of C+D offer great deals and decent service.

Hey doc,

Very good point! I had some old government issue Lomotil which always has worked best for me, but never had to use it because I am paranoid about drinking the water.

Don't drink, so didn't pay any attention to the booze situation.

Actually, I loved the food and gained about 7 pounds last trip to Delhi for only 13 days. And that was with humping hundreds of pounds of commo gear up the stairs to roofs 16 hours a day. Indian curry is a lot milder than stuff stateside. I would gobble down the green and yellow, leaving my Indian connections sitting their with their mouths hanging open waiting for my head to explode.

The best food anywhere, tho (to my taste) is South Korea. I eat like a pig there. Stateside a little plate of sushi costs $20. In Seoul, 3 bucks - 2400 won - will get you a shoebox full, very fresh and yummy. Best I ever ate. Don't do kimchee though.

Source record: 204730

I know that most of the people that read this group probably disagree with the current US government position that it is illegal to monitor cellular phone calls. After all we live in a "FREE" country shouldn't we be able to do whatever we want with the signals that are forced through our homes and bodies? Technology is available to inexpensively encode cell phone transmissions and make it all but impossible for the casual listener to "listen in" so why should it be necessary to outlaw equipment that can receive these frequencies.

I don't want to debate the law or the constitutional implications of it but I would like to mention a side effect that I haven't seen discussed here or any place else.

Most of you probably remember hearing about the woman that nearly froze to death several weeks ago when she became lost and stranded in her car during a snow storm. Her only link with the rest of the world was her cell phone. As I remember the cell phone company was completely incapable of accurately locating this dying woman. She was finally found by a farmer that lived nearby that stumbled onto her car purely by chance.

Most communities are filled with radio amateurs (hams), many of which practice the art of "fox hunting", the ability to quickly locate RF transmissions coming from a hidden transmitter. Most hams will also jump at the opportunity to use their hobby in public service. The equipment used by these fox hunters can be easily adapted to the cell phone band. I submit that if it weren't for the current regulations making it illegal to receive cell phone transmissions she could have been found much sooner, probably in a fraction of the time, by the fox hunters in the area.

But since it's illegal for the general public to receive these transmissions I guess we will have to rely on the government and cell phone companies to respond to this kind of emergency. I know if my life depended on it I'd much rather have the local fox hunters out looking for me.

hey anyone know the routing the BA (British Airways) aks "Speed Bird" take when they leave Phoenix. Several times, I have been outside with one of my hand held scanners in hand. i looked up and saw an aircraft (DC-10) with a dark blue tail...I heard the controller clear "Speed Bird" Direct to Gila Bend. PHX also had a LTU flight that goes to/from Dusseldorf Germany as well as some flights to parts of Canada and Mexico.

Wonderwhy Lufthansa does not fly from PHX to FRA..they have a pilot training facility at the GYR airport west of Phoenix.

Why would this aircraft be heading toward Gila Bend. That's Southwest of Phoenix on What I think is the Mobie Departure Routing. Does this flight intercept J2 or J18 or does it go to San Diego or some other Destination to the west. I heard the flight on Phoenix Frequency 124.1..that's used during the day for South and west bound departures and arrivals. 119.2 or 128.65 are used for traffic arriving and departing to the North.

You would think lights bound for Europe would head north on the Eagul routing toward Winslow (INW), Saint Johns (SJN) or Zuni (ZUN) ...

From: ramjet@interlog.com
Message-ID: <5ftb59$i0a@news.interlog.com>
Source record: 204735

HI!
If I have my AR8000 hooked up to an IBM machine through the computer interface is there any software that can automatically read the frequency switching tones and switch to the correct frequencies. For example, to keep track of switching cell frequencies. If you know of such a computer program please let me know. Also any details as to how it works would be great too!

I have also heard of the OptoElectronics Scout but even after looking at OptoElectronics WWW site I am unsure as to what it does. Could anyone out there explain what it's major functions are and how it would be of use to me with my AR8000?

Thanks,
Andrew

In a previous article, gwinters@ridgecrest.ca.us wrote:
->Any opinions on the RS Pro 34 200 chanel? I can purchace one like new
->for $100. Will recieve cell phone.

$100.00 sounds about right. It was a pretty good scanner in its time but by comparison now has some flaws. It depends on where you do a lot of your listen, as imaging is a problem.
I do a lot of Federal, and have problems with two meter ham images.
800 MHz can also be trouble.
It seems fairly stable in the UHF Federal area however.
Squelch is actually a bit mushy for cell too. This can be a problem.
Nice big display is a plus.
Good Luck,
Phil

4672. 144/440 ham antennas for scanner?

Newsgroup: rec.radio.scanner
Date: 1997-03-09 00:00:00 UTC
From: gpitts@ix.netcom.com
Message-ID: <332244dc.8861176@nntp.ix.netcom.com>
Source record: 204739

Just curious if anyone has had an opportunity to compare a high gain 144/440 or 144/440/1.2 antenna against a generic scanner antenna such as the Channel Master 5094/5095? I know they've got to do better than, say, a Radio Shack discone, but I just wonder if they perform well enough to warrant their $150-$200 price tag (in scanner service). If anyone has had a chance to compare such an antenna, I'd like to hear your results. Thanks!

Hello all,

I'm looking for design information and directivity patterns for a corner reflector groundplane antenna. This is supposedly a highly directional VERTICAL antenna (vertical YAGI'S aren't as directional as horizontal ones due to side lobe effects). I want to be able to reject strong in-band back as well as side interference in the 900MHz public service band. If anyone on this news group has experience or info on this subject I would truly appreceate any help offered.

regards,
techno

At 900$ for such a unit, it would be akward to place them externally
and placing them internally would void your warranty. I would listen
to this guy...:-)
BTW, can anyone comment reagarding sensitivity of these units (range,
etc.)? Don't they receive too much junk to handle?

4685. Communications Electronics Inc. any good?

Newsgroup: rec.radio.scanner
Date: 1997-03-09 00:00:00 UTC
From: James Herr <herr@worldnet.att.net>
Message-ID: <332278B3.5856@worldnet.att.net>
Source record: 204752

I will be ordering a BC3000xlt soon and noticed that Communications Electronics Inc., had a $329 price which is pretty good, and they include an extra ni-cad battery pack for free this month. Their shipping is kind of high at $17, but considering their lower price and the free ni-cad pack, it seems worth it.

Any good or bad experiences to tell? (Or if you know of a cheaper price, that would be good too. :^)

Thanks,
--

most alpha paging uses the POCSAG format (three possible speeds: 512, 1200, 2400) or GSC(Golay) (600 speed). New is FLEX format (1600,3200, or 6400 speed).
Decoders that do all three don't exist, but I've used a Universal M-8000 to decode parts of some POCSAG transmissions. But only a few messages could be read.
Each message is preceeded by a capcode (pager number) then the message. They come through at 3 per second, so you gotta be quick. They're mixed in with numeric pages (phone numbers).
Also tried some software based stuff with similar poor results.
My receivers were good: R-7100 and R-9000.

The Universal is sold by them at 800 431-3939.

I have an RS PRO-2004 Scanner. My scanner started developing problems shortly after the blue backlight went out. When I turned the scanner on, It would appear to be dead for a couple of seconds before it would power up and work perfectly. As time went on the lag time before it would power up got longer and longer to the point where it now no longer powers up. I tried connecting it to a 12 volt power supply to rule out a defective internal power supply, but that didn't work either. Anyone else have a similar problem with there 2004? If you have any suggestions on how or where I can get it repaired, please E-MAIL me.

Thanks,

Paul Zap

From: stephens@ricochet.net
Message-ID: <3322399e.9477487@news.ricochet.net>
Source record: 204757

Hi Ya'all!!

In the past I have had a few Radio Shack handhelds, and have been very pleased with the results...so I kinda know how these things work... (I used a self created 520MHz antenna: whew! the police always sounded like they were next door!...San Jose, CA police)

The AR8000 seems to be a fine receiver from what I can tell on the EDCO web site. I especially appreciate the backlit LCD.

I am interested in 1. police scanning, 2. cell scanning

On the police scanning: The Highway patrol in California use 2 frequencies, one for transmit, another for receive, at 27Mhz. I have always been baffled on how to get both sides of the conversation with a scanner. Is it possible with the AR8000 to set this up?

On the cell scanning: From what I can tell, I would run into the same problem as above, for starters. Also,
a) is it possible to buy a non-cell blocked unit in Canada? (I have friends there) How about Europe? (I have friends there too)
b) if I buy a cell blocked unit, how does one bypass this? What does it cost? (I'd be happy to reimburse someone :)
c) it seems like the Feds are going to force EDCO to increase the difficulty of unblocking...I should get one soon then, no?

I would also like to establish communications with people that have one of these seemingly exciting radios.

THANKS!
-ron

Here you go

****Uniden Bearcat BC9000XLT Tricks****

Info from Dave Rodriguez (Uniden Corp) & Jeff Zeman (73252,3645).
Additional info from Bob Parnass (Monitoring Times)
File written by SYSOP*Jeff Goldman WA1UDB.

By holding down the 2, 9 & DLY keys as you turn the 9000XLT on, you
enter a
sort of Test Mode. To do a "keycheck test" you can hit any key or turn
the VFO
knob either direction and the alpha display will tell you what key
you're
touching or which direction you're turning the VFO knob.

At this point, if you momentarily hit LOCK (to the right of the VFO
knob) and
one other button various things will happen:

LOCK & C - REPLACES ALL MEMORIES w/1300MHz and alpha-tags channels 1-250
with CH 00-249 in the display. Again, will effectively wipe
out
your memories!

LOCK & D - Checksum and Firmware Version Number (v.09 in ALL 9000s to
date)

LOCK & E - LCD Display Test

LOCK & PROG - Runs a short, continously-repeating Demo Program
incorporated
specifically for showing at the Jan 1995 CES in Las Vegas.
It
also sounds attention tones as the message scrolls on the
display! (Note that the word "scanner" is spelled "Scaner"
in

the demo program; it was too late to change this booboo
that
originated in Japan.)

The last three tricks will NOT wipe out memory. Only LOCK/C will do
that.

Additional notes

There are more tricks, but they're currently being translated from
Japanese.
One of these has something to do with using the CTCSS button to change
"Decord" from High to Low. No info yet on this.

The Uniden Sales Dept specifically requested that cellular images be
included in the BC9000XLT (since it's legal to do that). The front end
was
left wide open to allow this in the 360-385MHz range.

No reason available on why the FM filtering is narrower (ie less HiFi)
than
on the BC8500XLT. It was done in Japan without explanation.

The audio amp doesn't shut off as in the BC8500XLT during quiet periods.
There
was an improvement in the circuit, but this means a bit of hiss when no
transmissions are coming through.

All BC9000XLTs (whether built in 1994 - serial numbers 45+ - or in 1995
- serial numbers 55+) have firmware version 0.09. And all have AM mode
available on any frequency the scanner is capable of.

The BC9000XLT is capable of having an alpha tag attached to any channel,
but
250 tags is the limit. (This was verified by doing the LOCK/C trick. The
scanner loads 250 tags and shows a memory full warning if you try to
enter
additional tags.)

A tip from Bob Parnass (Monitoring Times)

You can use the SND button during a Search as a sort of Radio Shack-type
MON button, transferring a freq to any bank you'd like to become your
"Monitor" bank. With RS scanners, you have to go through extra steps to
transfer the memories from Monitor channels to permanent channels.

:
:Why does mine only get 23.28748 miles? Should I soup it up or
:try for a refund?

I believe that your method of measurement is faulty as the BC350A is calibrated for the reception range of 23.2875 miles. Of course it's possible that capacitor C345.3 may need adjusting as it sets the range. Otherwise your stardate may be out.

:thanks in advance, "JG" a fellow freq freak

Cordless phones are from 30.075 to 30.300 in 25 Khz steps while baby
monitors are found on many differant frequencies including 30.400,
30.600, 36.700, 37.600, and even 27.085 Mhz.

I live in an Apt. and have one hooked up to
radio shack part #20-023 (Clip on antenna
mount)that I have hooked on a curtain rod.
It works very well this way:)

extend all nine sec. for
25-50 MHz
50-54 MHz
108-136 MHz
extend only top four sec. for
138-144MHz
144-148 MHz
148-174 MHz
extend only 1 to 3 lower sec. for
220 MHz
380-450 MHz
470-512 MHz
800-900 MHz
1296 MHz

>Yes, but the question must be, who invented America :-
- A Welsh man invented America - years before Christoper C did !
America belongs to Wales!

BTW: America DID NOT invent: TV - it was a Scotsman Logie Baird.
Telegraphy was in use long before America was even thought of!
although Sam Morse did contribule to "electrical" telegraphy. the
electronic computer is an English invention. Voice radio was an
Italian

AND WOTS MORE - John Wayne did not win World War ll all by himself -
he had some help from Audie Murphy, Roy Rogers and Trigger!

Have a nice day...

>Andy Entrekin
Most all scanners work into a 50 ohm ant. If this ant you mention is cut to
the freq and has an imp matching the input imp of the scanner it may work.

> finger on these.

Unless your area is covered in a Scanner Master publication or Monitor
America, you'll be hard pressed to find these codes. You'll probably
have to go on doing what you are currently, and what the rest of us
do as well. Just like the 10 codes are not standardized, neither are
the "Signal-" or "Code-" codes. Each municipality likes to re-invent the
wheel.

Luckily, the local police take a lot of theirs from the state police
which can be easier to find. And I've heard of people who have reported
that the 10-codes are changed every now and then just to keep us
scanner-
heads in the dark.

There might be someone in the area, or a club that has a good list
going...the trouble will be finding them! Good luck!

When I moved to a metropolitan area a couple of years ago, I had to
upgrade from a double-conversion scanner to a triple-conversion almost
immediately, due to a maddening level of intermodulation.

One advantage of double-conversion that I haven't seen mentioned here
much is that you can often pick up cell-phone conversations as
"images" in the frequency ranges adjacent to the blocked ranges.

Well the converter does work, but only when the signals are very strong.
Probably the sensitivity is poor. I regret spending $89 on that thing.
Ramsey should feel ashamed of its poor product.

The Kenwood TH-79A also does this, and it is easily modified for public service use, if you have need for it.

This radio ran me $525 in NYC, and has two separate transceivers usable for VHF/UHF, VHF/VHF, and UHF/UHF.

so waht, i don't care...if It's floating through the airthen I should be able to grab it!!

I believe that you had better become a little more articulate with your reasons for scanning these bands if you are ever caught. If its floating through the air I should be able to pick it up won't cut it. Look at the handful of states that radar detectors are illegal, They only pick up the signals sent out by police radar units.

You can't reprogram the ESN via the keypad on any phone. You need an
eprom writer/burner to do this.

Mountain NewsNet, Colorado's Emergency Incident Paging Notification System is expanding and will soon have alphanumeric incident paging coverage available in the followings areas:
- Statewide Colorado
- Statewide Wyoming
- Western Nebraska (Statewide Nebraska possible)
- Billings, Montana area
- Rapid City, South Dakota area

Do you monitor in any of these above areas and are you interested in breaking news (Police, Fire, EMS, Severe Weather, Major Traffic, Mountain Rescues etc) delivered directly to your own personal alphanumeric pager? Well then please contact me at jimmnn@frii.com or check out our web site.

National incidents? Why certainly we have reciprocal agreements with 30+ similar type FireNet systems in most major cities across the country and there major incidents will also be sent directly to your pager.

Happy Monitoring!

That is surprising...because I put my converter on the kitchen counter top next to the microwave oven and I couldn't hear any cell calls. But, then I put the converter IN the microwave oven and turned the oven on DEFROST...well, I knocked every cell site in the county off the air! Fortunately, they haven't traced the cause of the outage and I am going to lay low for awhile...I'll be eating cold oatmeal for awhile until this things blows over.

Well, if you don't feel that cell listening is totally essential...
You might want to check out the Pro-60 currently on sale at RS. s should do
just about everything else you could want including Mil-Air and WFM capability.
BTW, although the sale price is $199.00, if you open and use a RS charge at the
time of purchase you get an additional 10% off! This makes the price $179.00!
Not a bad deal.

Should be possible for any receiver. The car transmit
frequency will be low power and therefore difficult for you
to receive. Perhaps this is what has troubled you? Many
repeaters will re-transmit the input so that you will hear
both side of the conversation at higer power levels. Is
this not the case the Highway Patrol there?

Should be able to get one from Canada or Europe. As for
restoring, it requires an interface cable to your PC and
some software. You can either buy yourself($150 or so?) or
find someone in the area who is properly equipped and ask
nicely!

As for the Feds changing FCC cert on the AR8000...even if
it went into effect today...me thinks it would take a while
to empty the current "warehouse" inventory of those units
that are already approved.

Good luck!

Well, i must say, I currently own the MVT9000. I used to own the
AR-8000. The 9000 beats the 8000 hands down. You don't really need
computer control in a handheld. Unless of course it is your primary
radio and you are using it for base operations. When buying the 9000 I
didn't even consider the fact that it had no interface. My AR-3000A does
that. :) Computer Controlled Scanning is great. Some people say, when
you computer scan, your really not listening, your just playing. Not so.
While the computer is scanning and logging, I always have another one
going for Listening.
Good luck in your decision, Whatever you may choose.

> range from 140-180 MHz many times.

I know that where I live they were doing the same kinda thing a few
years
back. Although they were tracking skunks and foxes. You're in the
right
band - but the signals are usually just a short "beep" of a carrier.
ie:
they would sound like a short squelch opening on an FM scanner. Here
they
used different frequencies for each animal - and I can't for the life of
me
find the frequencies....8-(The signals are very, very weak!

I know this isn't much help - but I think if you are persistant you will
find something. I'm surprised that the conservation folks didn't give
you
the frequencies.

Cheers

I found that the unit did not work if the antenna is located
near the unit. Perhaps it is unstable. It worked OK when separated.
Better results can be obtained by placing a LNA at the input.
About your comment regarding spending $ for the unit, I feel the
same way about their radar gun.

Techno,

I have modified my RS 2032 for computer control. I took the brute for approach and wired a CMOS Matrix switch across the keypad. This cost about $10.00 in parts and works just fine. I have a windows program to download freqs to the radio.

Although my interface allows me to read data back from the radio, I have not programmed it yet. There are several ways to do this. Most scanners are going to have a synthesizer chip that has a serial programming interface. I planned on monitoring the data, clock, and load signals going to this chip in the 2032 and determining the current frequency from the serial programming stream that appears on them. I would monitor the squelch signal and LO select as well.

Ultimately, I will use the same three wire interface to set frequencies during scanning.

If you would like to take on such a project and need help, drop me some mail. If you have a radio in mind and have a schematic, it would be helpful if you could send me a copy.

I bought my at the same price. I like it, though be warned that it occasionally has a problem of receiving the NOAA weather broadcast at 161.190, smack in the middle of the railroad frequency band. It does not happen all the time. (I had bought an RS base scanner which had this problem all the time.) Apparently a problem with filters or something.

You might want to look at the PRO-60, which has greater coverage. I almost took mine back but decided I really wasn't interested.

BTW, you can get the PRO-26 for about $350, but not from RS. I think that Grove has it for that price.

This is the top of the line STANDARD amateur dual band HT that makes a heck of a scanner...

The AM aircraft receive is the best I have ever heard...sounds like a quality car radio...

You can check out the specs at www.stdradio.com

It comes with a nicad battery pack and charger...I bought the AA battery case and will throw in 24 alkaline batteries(uses 6)...the DC power cord and DC adapter...the leather case...and the 100 channel memory chip so now you have 50 VHF and 50 UHF.

It will scan both bands at the same time in five banks of ten...you can select any or all banks or 1 mhz scan or lockout memories and just scan the ones you want.

The radio sells for $500 and that is what I would like to get...the other goodies are worth a little over $100 so that is what you get for free...

I will ship two day air in the US.

e-mail with questions...

> of these drunk, sorry ass losers!

"I know that I caused a a few divorces..." and you are proud of that?
You sound like a good reason to start stronger enforcement of ECPA
provisions. Why do YOU care if some one is cheating on thier spouse?
Is this any of your business? Do you look through your neighbors'
bedroom windows too?

You think you are saving humanity? Why don't you climb up the telephone
poles in your neighborhood and monitor what everyone is doing? If
someone is dealing drugs somewhere you obviously have the right to
listen in and then sneak to some phonebooth to call the cops. Do you

talk through a hankercheif? Seems you have proclaimed yourself a morality monitor with wiretap authority.

You sound like a cowardly, trouble making, voyeur to me.

You're making "scanner confiscation" sound like a good idea.

> TYler

Any free-running oscillator is useless in this and similar application.
Even if you will get a stable oscillation at your bench test, you can't
use this circuit in a radio transmitter because stray RF will null all
your efforts done.

If you want to keep all the circuit but the oscillator, it's better you
use a crystal controlled oscillator. The cheapest solution I suggest you
is to use a C-MOS 4060 oscillator/divider. If you put a 3.579 MHz
crystal (very cheap and common), and you use the pin 15 as output, you
will get a very stable 3.4961 KHz square wave.

If you want to change the whole circuit, I suggest you to use one of the
available single-chip, full duplex band inverting scrambler/descrambler.
Not very cheap, but very few component count, easy to build and, most
important, crystal controlled. Once I put one of these inside an
Hand-held, dual-band transceiver: great!

Ciao, Giovanni.

I suspect it would be modulated bursts with a fairly significant
time-out interval. The burst is probably encoded, and they're
probably all on the same freq. This is pure speculation. Sounds like
a fun project.

Mark

Of COURSE it's my opinion.
Whose else would it be?

4763. Re: Cellular on PRO-60

Newsgroup: rec.radio.scanner
Date: 1997-03-10 00:00:00 UTC

IMAGE FREQUENCY... CURSE OR BLESSING?

The intermediate frequency (IF) number listed in your instruction manual multiplied by two supplies you with the image frequency. For most units on the market the listed IF number is 10.7 or 10.8 resulting in 21.4 or 21.6 respectively. Rather than go into technical details, let's see what it can do for us, or to us as implied by the heading of this paragraph. Some scanners are not designed to receive a certain frequency ranges, particularly the 138 to 144 MHz range in some older or entry level models imported from other countries. Many communications in Canada take place in this range and it is important you can program numbers in this band. If your model lacks this range you can use the Image Frequency to benefit.

For example, the number you want to monitor is 142.5000. When trying to program it your scanner shows "Error," simply add or subtract either 21.4, 21.6 (some models use 21.7), depending on your scanner and enter this new number. In our example the number becomes 142.5 + 21.4 = 163.9 MHz. If your unit has limited UHF the same reasoning applies. If the frequency you need is 422.15 the number to enter becomes 443.45 MHz. You can now receive all transmissions on the original frequency, although the signal may be weaker and not as clear. Since many transmitters use high power, this presents no problem. On the other hand, when tuned to 142.5 and a powerful transmitter on 163.9 is fired up, guess what...your favourite frequency just got wiped out. Folks in large metropolitan areas are all too familiar with this situation.

---Excerpt from Haruteq Scanner Book (Ontario Edition) 1991.

Pro-60 IF numbers:

1st.....608.005 - 611.2 MHz
2nd.....45 MHz
3rd (WFM).....10.7 MHz
3rd (FM/AM).....455 kHz

What you are listening to are the image frequencies of cellular broadcasts. I know that some of these numbers don't exactly jive with what I have supplied here. It would require an intermediate frequency of 374.4 MHz but it is the only possible explanation I know of.

>(......)
Interesting review from Avo. I recently wrote mine with similar opinions
about the antenna, the radio and the firmware performance. I still wonder how
Icom has made possible such a good radio (not forgetting it's just a scanner)
along with a so poor performing firmware. I was supposed good firmware is not
larger neither heavier than a bad one inside a uP!

What I absolutely dislike after one month use is:
1) The impossibility to read the alpha labels of the memories when scanning
is active. I must stop the memory scan, enter edit mode or dial up/down, and
then restart the scanning.

2) The one-or-all bank memory scan.
3) Frustrating "speed" in both scan and search.
4) The target auto-memory store bank is fixed (Q) and it is always cleared when this scanning mode is started, even if there is still room for new frequencies.

There are many other things I dislike less and thus I don't list, and others that are related to functions (as SigNavi, AFC, VSC and BandScope) I gave up to use even if I paid them as they were good.
Actually I'm keeping my IC R10. For the first time I was almost to return a radio to the store and buy something else but...what? I needed a portable scanner, and this IC R10 is really more than portable: it disappears inside the pocket.
What I really hope is that Icom will release soon a new firmware version, and that the charge for the updating will be affordable. Bottom line could be: I pay service center for desoldering/resoldering job, but the bare new CPU is free of charge.
But I guess this is just hope...

If someone will be so kind to put some updates about this issue on this newsgroup, he/she will get my foreverlasting gratitude.
Happy listening, Giovanni.

The Regency ACT-E-10 HLU covers 30 - 50, 148 - 174, and 450 - 470 MHz.
It has IFs of 10.7 and 0.455 MHz, and employs an AFC circuit.
Crystals may be ordered for $5 each through your local Radio Shack.

Schematic is published in Sams monitor servicing book SD-7.

>If you see a police officer exceeding speed limit without lights/siren,
>take down car # or license plate info and call the department ask for
>supervisor and report it.

By law (in all the states that I am aware of) officers can ignore traffic laws as long as they have a good reason for doing so. They can park in fire lanes (as long as they have a reason...like responding to a robbery or going on an ambulance call with the paramedics,) they can speed (see above...also, how do you expect them to catch up to a speeder if they themselves don't go over the limit...hmmm?) They can choose to signal turns or not (see above,) they can run stop signs/lights (see above,) etc. They cannot be ticketed for the "violations" as long as they have good reason for it.

(Dispense with all the over-used remarks about "speeding to the donut shop..." We've all heard them before.)

Individual departments have internal policies about this, which vary from one to the other. But think about it without a big chip on your shoulder...it only makes sense that they can speed (or whatever) if they need/want to. How do you expect them to do their job?

As a citizen, you can sign a ticket for a traffic infraction committed by someone. It doesn't have to be done by an officer. I suggest you contact the Police Department next time you see an officer speeding or whatever, and say you want to sign a complaint against him. Tell the judge your story then...see what happens.

So many people think they know more about police work than the police, but they don't.

First let me apologize for responding to this spam. This reply, like the original post does not belong in most of the newsgroups it was posted to. However I thought it important that anyone that read the original post be alerted.

These folks are just trying to get your money. While they will read your synopsis for free. They will generally ask for a fee of $75.00 to $500.00 when they invite you to send your complete manuscript. And they WILL invite you to send your manuscript and MONEY. Legitimate agents will charge a percentage of the money they make for you. They will not charge you to read your work.

Woodside, or whatever they are calling themselves these days, have been kicked off of virtually every ISP for spamming and other inappropriate activity. They seem to be existing today on the "try us for XX hours free" offers that fill most of our mailboxes. Do a Dejanews search and see how often their ISP changes.

For more information see the following:

Hi Adrien,
You just missed it. Try to tune in to 146.910 MHz next Sunday night at 8pm local time.
For over an hour that frequency will be full of useful information and frequency listings for Montreal and area. There will also probably be an announcement of a phone number you can call for information (called a gateway).

Welcome aboard.Have fun,

>
> Thanks,
> Brian

Brian, the reason that that unit is NOT available in the US is that it can clone one AR8000 to another; i.e. if you have a cellular unblocked AR8000, you can clone it to a cellular blocked unit, and you will remove the block. The AR8000INF was available from EEB, and that is the US "official" interface cable.

If you want a CU-8232 unit, it is available from Javiation:

http://www.demon.co.uk/javiation/index.html

For an alternative, and an interface that will handle ICOM CI-V and the AR8000, use the CAT-232 uni-versatile interface from the Scancat people:

http://www.scancat.com/

The Optoelectronics OPTOLYNX is also an option.

Eric,

Yes I believe The Ar8000 is worth the money.

1. It has very wide Coverage 100Khz - 1900 MHZ
2. Very good sensitivity
3. Easily Restorable Cell.
4. Small & Lightwieght
5. Can be easily interfaced with Computer for easy Programming,
scanning Etc.
I hope this helps a little.

Ed

4783. Scanner Prices in Canada?

Newsgroup: rec.radio.scanner
Date: 1997-03-10 00:00:00 UTC
From: jweaver@newbridge.com
Message-ID: <jweaver-1003971018290001@macjonw.uk.newbridge.com>
Source record: 204587

Does anyone know how much a Yupiteru 7100 or AOR 8000 would cost in Canada
(A rough price will do, but an exact price would be even better).

Am I right in thinking that it will have FULL coverage (i.e. 800Mhz)?

I am going on a business trip soon, and if the prices are considerably
cheaper than the UK, I would consider a purchase.

Any info would be appreciated.

Regards

Jon

Also Rich,
if you haven't done this (yet)
1.use mike input
2.double click on the speaker icon in the taskbar(volume contol window
will pop up)
3.select Options-Properties
4.under adjust volume for..select Recording (recording contol will pop
up)
5.make sure all the boxes are checked (there should be one for in-line
and mike)
and that volume slides are all the way up (max)

7.go back to properties and select..Playback, and lower volume control
to about
50% or so
work great for me:)

>

Barry,

I don't know where you got this info but it is not even in the ball
park.

But the 30Mhz band is mostly, Army,Airforce, Etc. 27.085 is channel 11
on the CB.

Here are the Cordless Freqencies, Baby monitors also use the same but
not all cordless freqs.

Cordless Channel# Base Freq. Handset Freq.

1 43.72 MHz 48.76MHz
2 43.74 48.84
3 43.82 48.86
4 43.84 48.92
5 43.92 49.00
6 43.96 49.08
7 44.12 49.10
8 44.16 49.16
9 44.18 49.20
10 44.20 49.24 11 44.32 49.28
12 44.36 49.36
13 44.40 49.40
14 44.46 49.46
15 44.48 49.50
16 46.61 49.67
17 46.63 49.845
18 46.67 49.86

19 46.71 49.77
20 46.73 49.875
21 46.77 49.83
22 46.83 49.89
23 46.87 49.93
24 46.93 49.99
25 46.97 49.97

Note: Older Cordless have only the first 10 channels, newer phones have 15 or all 25. The frequencies are not mistyped, they just don't always go in ascending order.

hope this helps,
Ed

I live in a suburb of St. Louis MO. Some of the terms used locally that I don't know the meaning of are:

DSN - and followed by a number or series of numbers

Codejis - Don't now how it's spelled but that's how it's pronouced. This term is also followed by a number or series of numbers.

Still Alarm

If anyone knows the meaning of these terms please post or send an email.

Thanks,

Dan Schopp

I would think that a good triband ham antenna would work best. Like one designed for 52/146/440 or 146/440/1.2 Gig. Depending on your interests. Diamond makes models for just about any ham bands. I buy most of my stuff from AES, their service is great and the guys who take your orders are all hams...73's

Being a ham, it didnt make sense to me to buy a scanner antenna cuz I
have several vhf/uhf antennas. My diamond v2000 makes a very fine
scanner antenna. My Create logperiodic makes probably the best scanner
antenna on the market! It has gain of 10 to 12 Dbi over the range of 50
Mhz to 1.2 Ghz. Its small about 6 foot of boom, and light about 6 Lbs.
I'd HIGHLY recommend it....Plus you get the advantage of TX on any freq
within that range....Jim

4792. Re: double or triple conversion scanner.

Jerry,
Conversion type will determine # and strength of images received.
Therefore triple will receive less than double...usually. And if
that was the Radio Shack Pro-26 you were looking at, be advised
that you can buy it mail-order from a Radio Shack dealer for
under $350 shipped to your door.

> anything outside.

it will in some directions. Running a wire of that length amoungts to a
true longwire antenna. It will become directional. A TRUE longwire is
at least 2 wavelengths long, the longer the more gain and the more
directional it becomes. Hears an idea how about an amplified TV
antenna. Radioshach has several and I think it might work well fior
you. Just be sure you get a model where you can vary the gain.
Different installations require different antennas, Just try a few
things and enjoy...Jim

Andy,
Try this which is pretty universal for Bearcats

1. Press MANUAL
2. Enter lower frequency limit
3. Press LIM or LIMIT
4. Enter upper frequency limit
5. Press LIM or LIMIT
6. Press SRCH

To pause on a frequency, press HLD. To resume search press SRCH.
To reverse search direction press appropriate arrow key.

I know if my
>>life depended on it I'd much rather have the local fox hunters out
>>looking for me.

AMEN to that!!!!! I was wondering the same thing. Where were the local hams? Of course, this is S. Dakota where you have to drive 400 mi. to get to the local ham.

>Does the law say "receive" or "listen"?

BFD!!!! If it was your mother stranded in a freezing truck, what are YOU going to do? I like the general interpretation of the amateur radio rules that state in an emergency, "ANYTHING GOES." Out of band, out of license, too much power, (legally), non-licensed users, WHATEVER!!! If somebody's life depends on your radio, you better damn well use it! If I ever get into an emergerency situation, I'm sure not going to take the time to ID before I punch up the autopatch and hit 911. (maybe after everything is over)
Tyler

Eric,
Sounds like you're in a good position to be a guinea pig for my
'Getting Started' page. Try http://www.qsl.net.n2mca/STARTING.HTM
and I would appreciate any feedback. Look under Features for a
description of VFO. As for having multiple VFOs, just gives you
more temporary frequencies to play with. I believe the new AR5000
has 5 of them(wouldn't mind that at all!).
Good luck!

Hi Steve,

> Forgive my ignorance but what do you mean by "CE badged version"?

As equipment sold in the USA has to be FCC certified equipment sold in Europe (EU member States) has to be CE approved. One of the "modifications" that AOR did to the AR8000 so that it passed the "CE" tests was to improve the internal RFI shielding and the inside of the case was sprayed with anti RFI "stuff".

I have no idea if AOR still produce two varients of the AR8000 (ie one with internal RFI and one without) - it would seem strange if they did and I would assume at some point that all shipments of the AR8000 will be the same.

> software allow me to do that I couldn't do with my scanner alone?

#1 Allows for unattended monitoring. You can do scans and searches and
the software will log times of 'hits', number of hits etc.
#2 Allows you to quickly and conviently download memory channel info
and alpa-numeric text. A definite plus with scanners now days having
500 & 1000 channels.

> Also, the Yupiteru's frequency range extends to over 2Ghz. I've heard
> that there is not much to listen to above 1Ghz. Is this correct? What
> type of transmissions use greater than 1Ghz?

Essentially correct for the 'average' scanner-head. Most of it(from what
I can recall) is amateur radio, satellite, and aircraft radio
navigation.

Good luck!

the DNR uses 150.00 to 150.50 here in MI for tracking turkeys... they use
the same directional anyenna system, as you mention... the signal is VERY
weak... I couldn't pick it up w/rubber duckie consistantly over 100
yards. The signal sounds like a very slow computer modem... the signal
varies with the activity of the animal.

hope it helps.... Rob.

Whilst RF board has seen some re-design over its current life the "Wandering Birdie Problem" can still occur on the CE approved varients. The main crystal on the logic board is the same item as it was on day one and has never been changed at the factory. It has been mentioned several times that this was "modified" but is no more than urban legend or if somebody told you they were misleading you.

Swapping the crsytral for a metal canned varient (4.9152MHz) will go along way to reduce this problem.

4809. Police "S" or "Signal" codes

Newsgroup: rec.radio.scanner
Date: 1997-03-10 00:00:00 UTC
From: Larry Giveans <LGiveans@worldnet.att.net>
Message-ID: <5g166f$mh2@mtinsc05.worldnet.att.net>
Source record: 204613

Just picked up my first scanner a couple of weeks ago through an ad posted on this board and am having a ball with it! Everything was exactly as the seller described - just goes to show there are still some honest people out there...

My question is this:

In monitoring the local police frequencies, there are quite often references to "S" or "Signal" codes. A handful I've been able to figure out from the conversation, many others I haven't because I don't hear them very often or I get lost in all the radio traffic. Can anyone E-mail me a list or point me to a list on the net? I've searched around and found all the "10" codes, "900" codes, etc. but can't seem to put my finger on these.

Thanks in advance,

Larry

Sound like you have something to hide! Whos wife have you been talking
to?
This is just another attempt to keep the people from doing what should
be leagal.
"it passing through my house" will be the argument forever. "Its in the
air uncoded and free". If the signal was coded and I was unscrambling
it, that would be a different story.
BTW do you support drug dealing, cheeting spouses, and drunk drivers?
Sound like you do!
I bet I saved someones life by getting those drunk bastards off the
road. I bet you wouldn't be whining and bitching if your kid had been
killed by one of these sorry ass losers. Then again you probally are one
of these drunk, sorry ass losers!

Heres your sign!

4815. ## Interesting scanner query

Newsgroup: rec.radio.scanner
Date: 1997-03-10 00:00:00 UTC
From: techno@actcom.co.il
Message-ID: <E6u3o8.J1z@nonexistent.com>
Source record: 204619
Cross-posted to: rec.radio.amateur.equipment,alt.radio.scanner,alt.radio.scanner.uk,rec.radio.amateur.homebrew,rec.radio.scanner,sci.electronics.design,sci.electronics.equipment

Hello fellow netizens,

Is there an easy way to read (by computer) the currently received frequency from a scanner (might depend on model of course), squelch status, or to program a new frequency into it? For some reason, scanners with FAST search capabilities (100 steps/sec or more) seem to always come without computer interface/control. Of course there are those hi-end scanners with built in computer interfaces. Their main drawback is usually slow search speed and high cost.
I've also heard about specific solutions (like Bill Cheek's CE-232 interface, compatible with the RS PRO-2004/5/6 scanners only. These are slow scanners and not available here anyway) but they don't fit me needs.

I was thinking of finding a signal within the scanner that changes state once (or any other fixed/predictable number of times) per frequency step, and monitoring this signal with an external computer and constantly calculating the current frequency. Does anyone know about such a signal within popular scanners (Uniden, Radio Shack, ICOM, etc.)
Maybe other methods exist too. I'd like to hear about them.

In addition, if I could find a unit with BOTH fast scan and computer interface, that would be best.

BTW, what is the FASTEST search speed available on any scanner in the 400-500MHz band, either built in or with the help of an external computer interface such as OPTO's or similar? Of course, the search step should be considered (i.e. there is a 300 steps/sec available at 5KHz steps on Unidens, but it is not available in the 400-500MHz band). Anyway, what is more important is the RAW frequency range covered per second. 300steps/sec at 5KHz steps gives 1.5MHz/sec. 100s/s at 12.5KHz gives 1.25MHz/s. So I'm looking for the maximum RAW frequency range coverage per second at 5, 10, 12.5, 15, or 30 search steps. I'm ignoring fast receivers such as OPTO's Xplorer (1 second lock!) because they capture too much junk to be useful for my needs.

Thank's for any help offered.

Hi Dave,

Unfortunately, neither scanner will hear above 512 MHz, there is no receive circuitry there. There may be a bad chip in the scanner showing the erroneous frequency, and I've seen invalid frequencies displayed in a 20/20 that was caused by poor soldering joints.

They were hand soldered and often poor quality joints. If you are handy with a soldering iron, check and resolder any suspect joints, and have a look at the memory backup battery holder, and make sure the secondary leads from the power transformer where they connect to the main circuit board are soldered on both sides. As amazing as it sounds, there can usually be found at least one or two places where there is no solder at all.

Bob Parnass has posted many of these fixes for older Bearcat scanners here in the past also.

The keypads in those older Bearcats has a foam pad that helps act as a return spring for the keys. Over time, the foam deteriorates and needs to be replaced. You can find another dead scanner with a good keyboard or make one yourself out of new foam using the keyboard as a pattern. Clean the contacts on the keys and keyboard, there is probably some foreign matter blocking contact on the non-working keys.

Hope that helps!

Jon, KF7YN

>of change for it, I have always followed his advice, and have never had
>any problems.
> Hope this helps.

Gee...sure wish the guys at Rad Shack had told me that when I bought it.
When I last talked to the tech at Intertan, he told me that the DC adapters
that were recommended in the catalog were not the best to use since they
didn't regulate the voltage output very well. The voltage would move up and
down with the output of the alternator and not stay at a steady 9 volts which
the Pro 51 requires.

Thanks to all for your replies. I'm still waiting for the parts to come in
for mine.

Ed

4829. ## Help: Search for handheld radio / radio scanner with computer interface/control

Newsgroup: rec.radio.scanner
Date: 1997-03-10 00:00:00 UTC
From: techno@actcom.co.il.NOSPAM
Message-ID: <E6t08o.FC5@nonexistent.com>
Source record: 204669
Cross-posted to: rec.radio.amateur.equipment,alt.radio.scanner,alt.radio.scanner.uk,rec.radio.scanner

Hello all,

This might resemble a previous query posted on this newsgroup: in fact it's a re-phrase of a previous posting, since I haven't found a working solution yet but have got new ideas with the help of the kind people that responded. I want to find about:

1. Scanner radios with computer interface, which support realtime detection (i.e. NOT just frequency down/uploading to radio prior to use) of squelch break while searching as well as reading the frequency locked to AND changing frequency by external computer control command. I've heard about various interfaces such as the ICOM (?) C-IV interface and others that can do this (I need pointers to similar interfaces too). FAST SEARCH would be a bonus.

2. To enable a smaller and cheaper setup, dual receive (i.e receive TWO UHF-UHF, 420-500MHz frequencies AT THE SAME TIME and sound them together in the speaker) handheld/mobile transceivers or scanner radios with similar capabilities would be nice if they supported the above required features.

All pointers appreceated. Thank's!.

regards,
techno

(P.S: please email directly in addition to posting here, so no responses are missed. Please remove the .NOSPAM postfix from the reply-to address (this has been done in an attempt to reduce the amount of junk mail received here from junk mailers. The correct address is techno@actcom.co.il. Thanks!)

4830. [Pro-26] DATA function

Newsgroup: rec.radio.scanner
Date: 1997-03-10 00:00:00 UTC
From: tcoles@tor.hookup.net
Message-ID: <5fvtfl$72p$1@loki.tor.hookup.net>
Source record: 204670

The manual for the Pro-26 says that if you enable the DATA skip function it will skip nonmodulated ord data signals, such as "control frequencies for trunked systes". Well, the police in my area have a data channel, and it search mode, with the DATA function on, the scanner still stops at it. Does this DATA function even work???

Todd

Interesting point. It may be legal to manufacture direction finding
equipment for the cell band as long as the operator of the equipment
can't listen to the cell phone conversation.

I was thinking more along the line of the doppler direction finding
systems that are popular among fox hunters. They are used in
conjuction with any FM receiver capable of receiving the frequency
required, many fox hunters use scanners. The ban on manufacturing
scanners capable of receiving the cell band will eventually mean that
most fox hunters will not have the equipment capable of receiving the
cell band required to use their doppler units on these frequencies.

And most hams don't have the budget to buy high end commercial
direction finding equipment.

4832. Bearcat 20/20 and 210xl scanner info needed

Newsgroup: rec.radio.scanner
Date: 1997-03-10 00:00:00 UTC
From: dlee@eskimo.com
Message-ID: <E6t43F.Kz0@eskimo.com>
Source record: 204672
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Just bought two scanners at a garage sale. Both are base units
that can also be used as mobile units. The better of the two,
the 20/20 seems to have been modified to receive up to 999.999Mhz
but when I try to manually enter a frequency above 512Mhz it says
"Error." In the presets, there are frequencies above 512. This is
a programmable scanner with a keypad and an A-B position switch to
change between the two banks. This scanner also has preset buttons
for aircraft and marine, but the marine button seems to be non-
functional. And sadly, the 1 key doesn't work.

My guess is that these two scanners were made around 1980-82.

Anyone have either one of these scanners and does anyone know
where I can find instructions on how to use them?

Thanks!

Dave

It's possible that problems might be caused by variations in the clock
that runs the serial port among different computers. A lot of shortwave
programs for fax and RTTY reception give the user a twiddle factor to
compensate for differences in this clock. For the program in question the
right spot to play around with would be the line in the main routine that
says:
dt = 1.0 / (4800.0*838.8E-9);
If I'm not mistaken the actual clock period is supposed to be closer to
840 nanoseconds. Another area where a wrong clock frequency would mess
things up is in the phase-tracking routine:
exc = exc + 0.020*(clk-exc);
Changing the 0.02 factor to something higher like 0.05 or 0.1 certainly
didn't hurt reception when I tried it. Usually I get most of the packets
intact unless I'm trying to monitor a system that's got a weak signal. It
might be totally irrelevant, but I'm using a Pentium 100 system and
running the program straight from DOS (no Windows). It also looks like
the trunker.exe program might need the same sort of tweaking to get it
working properly.

As a co-holder of the original patent for 'frequency hopping' radios, retired actress Hedy Lamarr will receive an honor from the Electronic Frontier Foundation on March 12.

The patent covering 'frequency hopping' was issued to Lamarr in 1942. She gave the patent to the U-S Government, hoping it could be used to defeat Adolf Hitler and company. The technoligy wa not up to the job in the 1940s. Weapons controlled via 'spread spectrum' technology were deployed (but not used) against the Soviet Union and Cuba in 1962. Much secure radio communication today uses spread spectrum technology.

--All,

Last night at about 10:30pm in San Francisco the local faults were busy again and we had two small (~5) earthquakes. Having a scanner, I immediately searched the usuall police, fire and "emergency" frequencies only to listen to police officers discuss several earthquake related car accidents, but that was it.

Does anyone know of specific frequencies/agencies to listen to to get more detailed information about an earthquake (size, location, etc.)

Thanks in advance...

I think you have very valid points that many in the general public do not understand, but in the same token, you need to see the other side. On a regular basis, I've seen police officers abuse the usage of emergency policies due to sheer laziness, or whatever. I've sniffed many police channels in my day only to hear nothing mentioned about a crime in progress, etc, and watching police cars blow stoplights and outright cause a hazard on the roadways. I am not accusing all police officers of doing this, but there are a few bad apples that ruin the bunch. People once trusted police officers and nearly worshipped the ground they walked on. Those days are long gone, with the constant cover-ups, corruption, and "Above the Law" attitudes most police officers give off. One incident I had with a cop was when I was pulled over for "looking too young" and was severely harassed because of the way I dressed and the way I had my haircut. They also insulted the girl I was dating at the time by making comments about her weight and hairstyle. Being scorned by this at an early age has made me bitter and I'm sure many people out there have had one incident or another that has scorned them. In the same token, I was pulled over for speeding once, and I actually thanked the cop for spending the time to explain why he pulled me over, and the severity of my crime. He wasn't cocky, he wasn't an ass about it. He merely stated the reason there was heavy patrol in the area. When I saw him in court, He was quite a gentleman when he was handling the case before the hearing, and we struck a bargain so I wouldn't get dinged by the insurance company.

I know I got off the topic a bit, but it proves that most of people's ideas of the way police officers use their privledges can be a bit misleading, and sometimes, outright illegal. As I said before, there are always a few bad apples that ruin the bunch...

I have an excellent condition tone/code finder with the interconnect cable from decoder to scanner. Includes comprehensive manual on how to connect to the Realistic PRO-2004/5/6 and Bearcat 760/950. Requires drilling a 1/4 hole into back of scanner and soldering the connection to scanner. You can:

Have programmable tone/digital squelch on your scanner

You can program in up to ten codes in any combination on any or all channels

Carrier squelch can be put on any channel

Asking $175.00 plus shipping with manual and cable. I do not have the 12VDC power supply but Radio Shack sells for around $10.00

Please respond to Fbals@aol.com

4850. mobile extender?

Newsgroup: rec.radio.scanner
Date: 1997-03-11 00:00:00 UTC
From: ralphn@informix.com
Message-ID: <5g4o86$t8b@news.informix.com>

Does anyone know what a "mobile extender" is?

Some of Uniden's Bearcat scanners have an 'alert' option that is
supposed to pick up on these "mobile extender" radios that apparently
exist in Highway patrol vehicles.

If such units exist, what do they do? Are they constantly 'transmitting'?

I was wondering if anyone had headphones for car races. Racing Electronics - http://www.racingelectronics.com - have scanner headphones that range from $30 to $100. Some show a 25db NRR rating - what does that mean? Any experiences with these types of headphones would be greatly apprecieated.

I recommend you get rid of the flat cable and put in a more
useful jack and cable setup.
I did so after only a week after getting my 8k two years ago.
I use the interface often and have had no problems.
you can get an idea of what I am getting at by viewing my
web page at ...
http://jsl.com/~stuver/ar8.html

Hopefully the guys at AOR use a different jack on any
new AOR radios.
Sorry I can't help you find that stupid flat cable.
I know they use that type of cable in fax machines and other
office electronic products.
Good Luck

Hey Ralph, From what I understand a mobile extender allows for the
officer to be away from his vehicle and transmit via a small microphone
looking device clipped to his lapel,that has a small antenna on it.These
extenders are usually quite low in power since the officer rarely finds
himself far from his vehicle.Here in Florida on the turnpike the radio
in the car is UHF and the mobile extender operates on vhf. This method
is often used by ham radio operators and they refer to it as crossband
repeat. Hope that helped you.Mark

4860. 235XLT Dual Conversion?

Newsgroup: rec.radio.scanner
Date: 1997-03-11 00:00:00 UTC
From: WA9YHX@AOL.COM

Regarding the new Uniden BC235XLT hand-held scanner with trunking capabilities; Is this unit actually a 220XLT with trunking capability? If so, is this receiver dual-conversion? I suspect that it would be susceptible to cellular overload on regular 800 Mhz freqs. as is the 220/200XLT models which are dual-conversion? Has anyone obtained and used the 235XLT in heavy cellular areas, and NOT had cellular overload and paging interference? Thanks for your input! Yea... just don't get the Xplorer within 30 feet of a transmitter or you will blow the front end out. Opto knows about this problem but says it would cost too much to fix it. (Like cost is a factor on an Xplorer!)

This seems to be a VERY common problem. If you are sitting in traffic and the taxi behind you transmits, kiss your front-end goodbye!

> BTW, can anyone comment reagarding sensitivity of these units (range,
> etc.)? Don't they receive too much junk to handle?

For the first few hours or so, you will find lots of paging and TV frequencies. Just lock them all out and you will not have many problems with 'junk' on it. Just remember that the unit IS a test receiver - it can't perform miracles. Also, the audio is VERY tinny, but what do you expect for such a small speaker?

The range is typically about 1/4 to 1/2 mile for relatively high-powered transmitters, up to 10 Miles or more for some TV stations on hilltops, as little as 100 FEET or less for low power portables, McDonalds (actually, you would be lucky to get 10 feet out of some of them!) and those nasty 800 MHz badland frequencies.

Like Paul said, a pin diode would most likely solve the front-end blowout problem, but I wonder how fast the front-end would blow compared to the reactiveness of the diode. (Does the diode clamp before the FE blows?)

This would not have cost much to add in, and why they didn't, I have no idea! They say it would have cut down too much on the sensitivity. But like you say, your warranty would be gone! After all, these have only been out for 6 months now!

Some show a 25db NRR rating - what does that mean?

In my Industrial Hygiene world a NRR is a noise reduction rating. If the item has a NRR of 25, it reduces noise by 25 decibels (dB). If the outside noise is 100 dB, and your item has a NRR of 25 dB, you hear 75 dB of the outside noise. So, it's a system to measure how much the item, usually hearing protection, reduces noise. If you wear hearing protection at work, your employer selects hearing protection which has an NRR great enough to bring the sound level down enough where your hearing will not be damaged. I hope this helped?

According to the Radio Act of 1934: it is perfectly legal to receive ANY radio wave signal. However, what you may hear you cannot repeat to anyone else! You may not be able to purchase a radio that will receive such signals; but if you can build one, it's perfectly legal.

Hi,

I am looking for an Optoelectronics OS-535 scanner interface
board for a PRO 2035 Scanner. I want a non-current production
board; one that was made/purchased at least 60 days ago. I
will consider package deal on scanner with board installed,
but would prefer to purchase uninstalled unit.

Thanks,

David Little KD4NUE

Don't know the exact frequencies for that area, but they will most
likely be between 144 and 148 MHz (the 2-meter ham band). During
severe weather these frequencies are quite active. If you use search
mode on your scanner with that range during severe weather, you should
have no trouble finding them.

I ran into the same problem with a customers scanner. Had a quick
look at it and found a cold solder joint. Its a large 1 or 2 ohm
resistor. I think its blue in colour. You will have to disassemble the
radio to get to the bottom of the PCB and fix the joint. If I
remember correctly there is also a heavy wire soldered to it that
comes from the transformer. I fixed it twice. First time I thought
it was a cold solder joint, second time it seemed like it may have
been the resistor itself. so I replaced it and it worked.......A month
later I hear its gone again. Not sure why this time but I will be
looking at it a bit closer. I suggest you check the same area I think
yours will be just a cold solder joint.

I cannot seem to find an appropriate cable for this beast, I fashioned my own but was hoping for one more robust. Anyone know where to get one? I have been told to snag the flat flex cable with 0.1" spacing, but this is NOT the correct cable, it looks more like 0.05".

Thanks a lot.

: adjustments in the code output,(tweak stuff, like maybe just an offset of 1
: or something like that, depending on the system being used.

What parts of the output coding has anyone adjusted and successfully improved reception? What offset needs tweaking and what types of systems would require this?

Most people who have communicated with me on this subject have reported very small bursts of data... just partial lines...no complete screen displays. With long periods of non-reception in-between bursts. Or nothing at all! If anyone can boast better... Tell US YOUR STORY!

Does this burst symptom translate into a problem with the rate which the serial port is read? Occasionally things line up and data flows for short duration... then timing gets out-of-phase and good data stops. These continue to cycle.

In additon, does anyone know the details on screen dimensions and cursor movement control codes for the typical MDC4800 terminal? Is anything at all known about the host software for the central node of these systems?

These MDT threads have slowed again... let us not drop it! :-)

-Bob

T.J. I had the same problem. Then a fellow Pro-51 owner told me how to solve the problem. Carefully, follow these instructions. Again, this will only work on Pro-51's with date code of 7A4 and earlier. Hold down the 2, 9, and MONI keys simultaneously. The scanner will go into display test mode. As the display fills up press the 2, 9, and L/O keys simultaneously and now for the tricky part, hold these keys down until the scanner opens up on 162.4 Mhz. If this is not the Noaa frequency for your area, your scanner may just start scanning. Thats it! Cell mod search Ch 22 and 23 and your off and scanning! Good Luck and hope this helps others.

Chris

Hope that it doesn't break down....Mine did after 9 months of indoor use
RS wants $75.00 to fix it- Without even knowing what is wrong!!!!
Sammy Salesdroid just looked in his RS bible, said $75.00 to repair,
then said " It's discontinued anyway, but we do have THIS scanner on
sale".....
Never again will I buy any scanner from them.!

4895. Bearcat BC-8500 sensitivity problem

Newsgroup: rec.radio.scanner
Date: 1997-03-11 00:00:00 UTC
From: Paul Racine <racine@ibm.net>
Message-ID: <01bc2e0d$36117ea0$7cca2581@willy>
Source record: 204552

Finally, I picked up my BC-8500 last night for only $175 ($25 cheaper than originally quoted). It is a nice scanner and all, but I am having a problem with the sensitivity. With the internal antenna it works fine, but when the outside antenna is connected, and the ground of the coax touch the rig, the sensitivity drops almost like the thing is shorting out or something. I called Uniden and they told me that if I want to use an outside antenna with this scanner I need to purchase the optional BC-004 RF AMP for about $28. WHAT GIVES! What is happening?

The antennas are fine. Anyone out there have the same experience????
Please let me know.

I have heard very minimal activity of South Park police on 460.250. They are still heard somewhat on 155.475, and 158.820. I don't know what they are using as their main dispatch frequency anymore. Looked in all the databases that are available, and there are no new frequencies listed for them. Anybody know what they are up to?
Thanks,
Frank

Chris,
You can try my pages at http://members.aol.com/frankn3mju/radio.html.
In the mean time here are some frequencies to try for the campus there.
453.150- PITT Police
453.800- PITT Police
155.265- STAT Medevac
463.200- UPMC Trauma team report radios
461.025- UPMC Montefiore security
461.325- UPMC Security
461.425- UPMC Escorts
461.350- Childrens Hospital Security
461.875- Childrens Hospital Security
463.775- Childrens Hospital Communications center
453.250- Pittsburgh Police
453.700- Pittsburgh Fire dispatch
453.850- Pittsburgh Fire fireground
154.785- Carnegie Mellon University Police
123.050- STAT Medevac air-air
There is more in the dbase you can download. Hope that helps. Frank

All,

Any military monitoring enthusiasts planning on attending the Dayton (Ohio) Air Show in July are welcome to join us for an informal "get-together" following the Saturday performance. This will be very casual, we'll just take over the back room of a restaurant somewhere near the airport and everybody can order dinner off the menu as they see fit. If you would like to attend please e-mail me directly.

JTWard@aol.com

Thanks,

John

>

No surprise at this.

My wife has done field work with deer using radio collars. And to protect the animals, the field biologist, and the research, these frequencies are just not published. It would be a serious and sad loss of field work and research to bother the animal just for the sake of finding a radio signal. Please don't.

Regards,

Dana

I have it. I like it; it gets all the freqs I want fine.
BUT it is NOT modifiable (sp) at this time that I am aware.
You may find that a scanner that has mods has better resale
or other (use) value. $180 is a good price. Good luck

4918. PRO-50 and Cordless Phone calls

Newsgroup: rec.radio.scanner

Stick with what you have. The Grove Scantenna is junk. It will fall
apart because of poor, cheap construction. Besides that, it don't
work with a hill of beans! Really!!! Hey put the back door towards
the rf source and the signal is STRONGER than if you beamed in
on it!

Message-ID: <332726D9.3CE2@terastat.com>
Source record: 204327

I'm looking at purchasing an AR8000 -- one of the attractions is the coverage from SW through 1.9GHZ. I was wondering what the reception was like in the SW (2-20 MHZ) band. I would guess that an external antenna is needed to get much reception in SW. Anyone have any experience? If an antenna is needed, what do you recommend.

The NHP is starting to fire up the new vhf system here in rural Nevada. Simulcasts can be heard on 155.61 mhz. Another one off the good ol' low band. (more 6 meter radios coming up soon?)

4925. "S" or "Signal Codes"

Newsgroup: rec.radio.scanner
Date: 1997-03-12 00:00:00 UTC
From: Larry Giveans <LGiveans@worldnet.att.net>
Message-ID: <5g7f5v$bo6@mtinsc03.worldnet.att.net>
Source record: 204332

I live in Hancock County, MS and in listening to the local police chatter on my scanner there are a lot of references to "S" or Signal codes i.e. 'Unit 15 respond to a signal 47 at 234 Main Street...' Does anyone know where I can find out what these mean?

I understand that a lot of departments customize these codes for their own use and the areas I need are Bay St. Louis, Waveland, and Hancock County Mississippi. Even a "standard" list of codes might be helpful...

Thanks in advance,

Larry

The PRO-60 has triple conversion, which means it has an additional IF stage. Thisis designed to eliminate weak and annoying signals and"Images". That also takes care of cell phone images. The Pro-60 is not capable of picking up cell phone at all. There are converters that may or may not be available any longer to pick up cell.

E-Mail Me.

The freq is assigned to the police of Springfield and Crystal Lake. It was used as the main channel by the tv crew and since it's low power, I don't think it caused any problems for the police agencies. I don't believe it was an image of the 800Mz spectrum because the antennas were on the VHF scale. However, who can be sure of anything nowadays.

4929. Re: listening to deer!

Newsgroup: rec.radio.scanner
Date: 1997-03-12 00:00:00 UTC
From: Jeff Singer <k0od@ix.netcom.com>
Message-ID: <33269B88.6462@ix.netcom.com>
Source record: 204336

Yesterday, I finally got trough to the woman who runs the Urban Deer program
in suburban St. Louis. She was pretty willing to talk about the program.

She said the each of the 100+ deer is on its own frequency in the 164-168 MHz
range. The transmissions have a range of up to two miles to their two trucks
that are each equipped with a 4-element hand-rotated yagi. The transmissions
are not continuous, but she was a little vague on how often the signals are transmitted.

She said they are currently just tagging the deer to get up to 125 needed
for the project. They have not started the actual tracking which will be
done by triangulation using the two trucks. The transmitters have a life
of about 4 years.

Anyway, armed with all this information I pointed a 10-element 2-meter yagi
in the direction of a large park a mile away that is supposed to be full
of deer. I heard precisely NOTHING...squelch on, squelch off, using AM,
using FM. No tones, No pulses. NOTHING!

Will continue to try.

I think anything is possible these days. I mean anyone from the US
goverment that is viewing this stuff sure isn't going to make it known
that they are. Even if they were to do so ,I doubt we would believe
them.

Then maybe it would be better to just give out the frequency and we
wouldn't have to get as close to the critters with our frequency
counters.

I believe that there is more than one format for 900 MHz
phones.

The digital based spread spectrum technology, of
which Hedy LaMarr did get a patent for, cannot be detected
via a conventional scanner. These phones are excellent- they
have great range and are immune to noise.
This technology is also used with PCS 1.9 GHz phones and some
cellular 850 MHz phone systems, and is commonly known as CDMA (Code Division
Multiple Access).

I think that there is also an analog 900 MHz phone that
does not hop frequencies. Not positive though.

If, by scanner, you mean a normal NBFM receiver, you are quite mistaken WRT listening to GSM calls. Even if they aren't using ciphering, they are vocoded, encoded, and burst transmitted. The channel size of a GSM carrier is 200KHz. That's a little large to fit into the passband of a NBFM receiver. It's a little big for a WBFM receiver and it's a modulation type that a FM receiver wouldn't understand, anyway.

Cheers,
David

I don't know if you have something similiar in the bay
area, but down here in Los Angeles, there are a couple
of ham frequencies which usually have alot of information.

I believe one of the repeaters is used by a group of
amateur seismologists who are also hams. (or is it
the other way around ?).

Anyhow, try searching the 2 meter ham band. 144-148 Mhz.

Scott, I would recommend 640 KHz.... a local radio station! Sorry, but as a State radio tech, I am unaware of any 2-way source where such events would be reported. Calif. Office of Emergency Services does have a few radio systems on which it relies in times of emergencies, but these aren't normally used for such things as reporting richtor readings. 153.755 MHz is one such freq, but it is shared with a few other agencies with hum-drum traffic... such as the radio maintenance technicians, state mental hospitals, and CDF youth inmate work camps.

: I still think you have something to hide....jerkoff

So, by your logic, the government should be cracking RSA encryption keys because obviously, if I don't want people poking around in my life, I've got skeletons in my closet I don't want exposed. (Never mind the fact that I do have a skeleton, in a box on a shelf in my closet left over from an anatomy class..)

I love this. Your argument is the same one that the United States government makes when it wants to put the Clipper Chip in wide(r) use. "We believe everyone has a right to privacy, we just want to catch people doing illegal things." Likewise, your fascination with this has me puzzled - if the government were to put a tap on your line and wait for you to do something illegal, you'd be the first one to cry out, saying "My constitutional rights've been violated!" Hell, if I turned you for doing the same thing, I'd expect nothing less than a civil lawsuit on my hands from you - unless you're a complete idiot, of course. There is such a thing as "expectation of privacy" that exists in the law, and most people using a telephone consider such privacy to be there.

Now, this is obviously flawed - we all know, from having played around with our scanners early on in our monitoring lives, that cellular and cordless telephones can be and are monitored. We've all heard something people probably don't want repeated - maybe nothing big, but something that might cause a little tension. Clearly, we need some kind of public information campaign to make people aware of the inherant dangers in using wireless technology. OR, we need to start lobbying the companies that make wireless communication equipment for private individuals to include either digital technology or encryption for signals. (And if you're inherantly opposed to this, then I'd say you really are a techno-voyeur with nothing better to do than meddle in things that aren't your business.)

It blows my mind that people on this newsgroup denounce the government for actively attempting to spy on its citizens (Clipper, wiretap legislation, that kind of thing), yet turn around and cheerfully do it to their neighbours and anyone who's "stupid" enough to use a cordless or cellular telephone. If there were police (no, let's make them FBI or AFT agents,

it's much more fear-inciting) that listened to cordless and cellular phones on a regular basis, without the benefit of a wiretap authorization, how many people on this newsgroup would be crying "civil rights violation!" the next day?

Furrfu. I don't care whether you're Demopublican, Republicrat, or Libertarian, but it'd be nice if people took a bit of uniformity to their opinions - you can't do it, and neither can I.

: Opinions are like assholes...everybody has one.

They certainly do.

: You make a law that requires you to wear a condom sound good.

And I once again re-iterate my previous comment about everyone having a rectum. 'Course, some people's are more distended than others, what with their head being jammed in there with feces up the nose..

Use this as a guide http://pages.prodigy.com/cseco/10codes.htm. After
listening to my local police for a while, it seems that they are pretty
similiar.

The CHP officers use an HT ("walkie-talkie" for the laymen out there) when out of their vehicle. THAT transmits on VHF (154.905 MHz) to the car which then goes back out on 42 MHz.

Generally, the highway patrol uses low frequency radios around 40 MHz, with a transmit frequency and a receive frequency. At such low frequencies, the antenna on a portable radio would be very large or very inefficient. To get around this problem, the highway patrol "persons" use VHF radios around 154MHZ that talk to their car radios, ie. the mobile extender radio goes out at 154MHZ and gets repeated at the 40MHZ frequecy from the highway patrol car. When the base station is transmitting, the higway patrol car will repeat this signal at the mobile extenders frequency. Thus they can maintain communications while out of their car. Now the highway patrol has been know to write a few WELL DESERVED speeding tickets. If you can hear the mobile extender frequency, they may be close since the extender is low power. That might be a clue to slow down. Most modern highway patrol cars turn on their mobile extenders only when the car is in park, which ruins this game since if the car is in park, they are probably out of their car giving a ticket, which means you were safe anyway.

This technique is not really effective in California since the highway patrol checks your speed by following you and using a certified speedometer. You could scan the mobile extender frequency to hear your name going over the air.

Mark,

You're really close, but the 'small microphone looking device' is
usually a standard portable radio usually (but NOT always) on a band
other than the band the mobile radio is on. The extender relays signals
received on the mobile to the officer's portable and vice-versa.

The names of the talkgroups are programmed into the mobile units - not
the base stations. The base doesn't send out the names, so any scanner
made wouldn't be able to display them. (Unless you program them
yourself)

Has anyone had any word from Gilfer Shortwave in the last month? I bought a Dressler ARA2000 from them and it's not been behaving correctly. I contacted Dressler who said I should talk to Gilfer, but Gilfer isn't answering their phone, faxes, or email.

Dressler also tried to contact Gilfer on my behalf, but met with the same result.

Are they all just on holiday for winter, or are they indeed gone?

If they're gone, I'm not sure what Dressler will be able to do for me...sigh...

Thanks,
Scott

>
Paul,

The R-7000 was not on initially when I found the images in the 137-142 MHz range. It was only after I
wrote down the frequencies that later I picked them up again (with the R-7000 on) and confirmed the real
frequency on the R-7000. The transmissions I heard initially were without any other radios on.

Please post if you can confirm my find.

Thanks

Source record: 204399

Beeing interested in a pocket size scanner,
i am reading many messages concerning R10 and Welz.
I read somewhere on the web that the actual R1,
the former Icom pocket scanner, is the 14th or 15th version.
Is it possible that Icom should prepare a debugged version
of R10 in short times ?
Or maybe one day a very expert listener can prepare a new more
flexible programmation to distribute by the web?
(i saw something similar about AR8000)
It seems only a question of different deep programmation,
(cross bank, scan delay, priority channel delay,
mode change while scanning...) not a work around circuits
and active radio components, is it?
What do you think about this?
And what about Welz WS-1000, does it scan one only bank per time?
does it scan with 2 seconds of fixed delay time?
I could find only some commercial advertisement
but non such items to comparate it with Icom r-10.
Good listenings and dx!
Roberto

I do not have an Xplorer and haven't tried this experiment.
Please let me know if you construct the following gizmo and
whether it affects the Xplorer sensitivity.

If you think overload may be a problem, construct an external
protection accessory from 2 fast diodes and some BNC hardware:

qty part

1 BNC T adaptor (one make, 2 female ends)
1 BNC male connector
1 right angle BNC adaptor
2 fast diodes

1. Solder the two diodes back-to-back.
2. Connect one leg of the diode pair to the center pin of a BNC male.
3. Connect the other leg of the diode pair to the shield the BNC male.
4. Plug the T adaptor into the antenna jack on the Xplorer
5. Plug the male BNC (containing the diodes) into one of the female
ports of the T adaptor
6. Connect the right angle adaptor to the other female port of
the T adaptor
7. Connect an antenna to the right angle adaptor.

```
|
|
| <-- antenna
|
|
| +-- T adaptor
| |
| v
|
+-+-= <-- BNC male plug fitted with 2 diodes, back-to-back
|

These are the wrong arguments. It is alright to listen
to portable or cell phone conversations as long as you
do not report their contents to anyone. The notion that
they will not manufacture equipment to hear them is also
bogus, at least in the near term. Any $80 Bearcat will
pick up a portable in the 40 mhz range. Getting a cellular
monitor is also easy, though not in the United States. Until
all these transmitters switch to data, they are not going to
stop people from listening. Congress really can't do
anything about it. Incidentally, I use both cell and
portable phones all the time, and could care less if
anyone is listening, since I mostly am revealing nothing
of importance. If you have listened to the drivel of
phone conversation as long as I have, you really don't
worry much about people's privacy. Very little that is
heard is even interesting. There are millions of conversations
out there on the airwaves, but few are of any significance.

800-297-1023

That's Uniden's number. When I called for a set of instructions, they sent them to me. I have a BC 200XLT and a BC145. The former will pick up cellular, the latter is simply for 40 mhz products. If your bearcat 101 is like the latter, you put it on manual and a number comes up. That designates the first second third etc. frequency you want to add. Then you use the numbered keypad to put a frequency in that slot (example 44.61) and then you put an E after it for enter. To check to see it is done, either look in the window on top of the receiver and see what the number is, or if it is a primitive bearcat, push view and the number will be repeated, single digit by single digit.

With the more sophisticated bearcats, you have 100, 200 or more frequencies that you can program. Usually the frequencies will be divided into ten banks, where you can access 10% of your frequencies or more, whatever you like. To program your radio, manually select frequency 1. When you have done that, simply use the numbered keypad to push in the frequency you want there, and push an E (also on the keypad) at the end of it to autotune it permanently (or until you come around and want to change it, using the same procedure). You do that for each frequency number (1,2,3,4,etc) until you have as many freqs established as you want.

Source record: 204404

I have an AR8000 and am interested in having some mods done. One is replacing the IF filter to prevent audio clipping. Also, I would like a coaxial computer interface connector installed. Can anyone recommend someone where I could send the radio and have this work done, and how much do they charge?

On the computer interface, I was wondering if a 2-connector or 3-connector (stereo) jack is used. If so, what are the signal lines used for? I would much rather use a connector like this for computer interfacing than the flat connector which looks shaky and unreliable. But is the computer control compromised by not having the squelch signal available to the computer?

Also, what kind of interface box does anyone recommend for interfacing the radio thru the mini-plug to the serial port on a computer?

There are also phones that will _automatically_ switch to a 'clear'
channel. The most likely thing to cause this would be the purchase
of a new phone by your 'neighbors'.

Easy Ron, don't get too paranoid now. Admit to what you want; do you
honestly think there are 'agents' scanning the newsgroups, looking for
someone to 'get'. I listen to anything and everything I find
interesting.
At times that includes cell and cordless phones. Now, _prove_ that I
listen to them. And prove that it's really me that sent this message....

Scott

You are not right about how this woman was found. Her
cell phone was used to triangulate the general area where
she was found, but the car was not visible, so she still wasn't
immediately found. I saw a report on how authorities used
her frequency to pinpoint the area she was in before finding
her.

Ron,

I called Uniden for those frequencies and there is no use
in having them. The 900 home portables use an old army
encoding system, that features both receiver and transmitter
in a constant state of changing frequencies, so you can't
hear anything anyway, unless you are programmed to follow
the changes in frequency. This is the same innovation that
Hedy LaMarr was alledged to have patented in 1942. It is
similar to Russian satellite technology. The Russian Sats are
moving in relation to the earth over the period of a day, so
the antennas that pick them up must move along the same
track in order to receive signals from them.

Mike Rice

->
->Todd

Frequency Fan Club at 800-RACE-FAN carry great headsets. I bought what they call the "Solution III", with 27dba NRR. I've used them at several races and they really work great. Cost is about $90.00 but well worth it. They are essentially "pilot type" headphones and protect your ears as well as allow for perfect radio reception from your scanner. FFC has a booth at most NASCAR races if you want to see the headset there.
They also have a nice little antenna called the RACE-TENNA. It's about 2" tall and only cost $12.00. I got it for races but found it works great on scanner when I want a more low profile antenna at any time.
This is not an ad of any kind, I don't work for FFC. I just purchased and enjoyed these products.
Hope this helps.
Phil

actually thats another solution although its a little harder. You could
use a FET in crowbar with a couple of fast microwave diodes for trigger.

>I have no idea if AOR still produce two varients of the AR8000 (ie one with
>internal RFI and one without)

Just out of interest.... Spoke to AOR about the CE 8000 not being as
sensitive on short wave as a non CE 8000.
They didnt think so until I explained I'd tried secondhand 8000's
against CE 8000's and the non CE were certainly more sensitive.
They said it must be the shielding.
I asked If they could still supply non CE 8000.... Answer NO !
but....you can buy a replacement case for the 8000 and its not coated
cost 7 quid front 7 quid back.

Are your channels 5, 15, 19, and 24 all within 49.000 MHz to 50.000 MHz?
If so, the people you are listening to have cordless phones that can
change their frequencies depending on the current reception quality.
Also, most multi-channel phones allow the user to manually change the
channel the unit is on. Some can cover 10 channels, others 24 channels, etc.

Well, let me ~try~ to answer your questions, , ,
1. More than likely the freqs are between 164 ~ 165mHz. They
use many different specific frequencies, so you just have to search.
They are tone bursts, kinda like the old sparkgap. They just beep!
They use a special Telemetering receiver to track these puppies. If
you want to monitor them, you have to do a "search", and even then,
it'll be tough finding them. when you find one, you have to turn the
squelch off, and you need a small beam antenna.

2. Nope! I don't think that they identify each one separately.
But, remember, this option will vary according to their needs.

3. See (1) above. These bursts are usually fired by a
capacitor. The ones I have seen are about as big as your thumb, and
the USAF and DI (Department of the Interior) were tracking Ravens, , ,
of all things. (This is at Edwards AFB, California.) Several years
ago, they tracked Desert Tortoises.

<<By the way, I don't believe it was in Los Angeles. I think it was North Hollywood.>>

North Hollywood is one of many communities in the San Fernando Valley which is ALL within the City of Los Angeles. Generally, when we refer to "Los Angeles" we are referring to the metro or "the city" area, such as downtown, etc.

BTW, what are you SUPPOSED to do with these types? Ask them very nicely if they would please stop shooting so that we can talk about it?

If "revenue enhancement" must come from somewhere, I can't think of a nicer group to provide it than habitual speeders. I myself drive in the right hand, "old lady" lane and usually leave the other lanes to those aggressive types who weave, tailgate and honk their way to what must be very important destinations. A gadget which will facilitate this behavior, the radar detector, thus has strong appeal to the arrested development cases with more than a little "jerk" in their personality.

If, after reading the above, you discover "the shoe fits", I recommend the

book "Zen Driving".

Exactly! A good fox hunter would have been able to locate here within
a few square feet. Not just the cell that her signal may have been
strongest in. In that part of the country how big is the area that
one cell covers 30-100 square miles? Even if the cell company could
have reduced the area to two or three square miles that's a lot of
area to cover by foot in a snow storm!

As I understood the news report the woman was very lucky that the
farmer found her, if he hadn't she probably would have frozen to
death. I don't trust the media to be 100 percent when reporting
technical issues but the term "triangulation" was never used in the
report I heard. I suppose the cell phone company could have reduced
the area to that of overlapping adjacent cells that could hear her but
how many square miles could that have been?

> Most people who have communicated with me on this subject have reported
> very small bursts of data... just partial lines...no complete screen
> displays. With long periods of non-reception in-between bursts. Or
> nothing at all! If anyone can boast better... Tell US YOUR STORY!

This is more-or-less "normal".

Data is sent in small packets (112 bytes?).. Each packet has an
"address" for the particular terminal it is headed for. Think of
each "packet" as an envelope, containing one "page" of document,
with an "address" written on the front. Consecutive "envelopes"
are sent to complete the "document" (or screen).

> Does this burst symptom translate into a problem with the rate which the
> serial port is read? Occasionally things line up and data flows for short
> duration... then timing gets out-of-phase and good data stops. These
> continue to cycle.

Depending on how busy the system is, consecutive packets may be
sent to the same terminal, or each packet may be going to a
different terminal.

The MDT's collect and "piece" together these packets to create
the original "page". It just depends on how the packets have been
"cued" at the transmitter.

If the MDT receives a "damaged" packet, it can request that the
data be re-transmitted.

MDT.EXE makes no attempt to sort out the packets. What you see is
the pure stream of the packets *as received*. In a busy system,
this can be very confusing!

You will see out-of-sequence packets, retransmissions,
aknowledgements, "garbage" characters (which may be the address
"headers"), etc. The text from one comm may be "broken up" with
text from another.

Also, generally you are receiving the "base" side of the
transmissions. Some of the short "bursts" are aknowledgement
(handshaking) transmissions to the MDT's sending data to the base

on another frequency.

Also, in Police units, the same "screen" may be sent to multiple
units after a "dispatch", which could account for some "multiple"
transmissions.

Again, it depends on the system design/software and how busy it
is.

> In additon, does anyone know the details on screen dimensions and cursor
> movement control codes for the typical MDC4800 terminal? Is anything at
> all known about the host software for the central node of these systems?

I'll go out on a limb and say that "MDC4800" is a transmission
"protocol", similar to Ethernet or RS-232, and does not specify
terminal types (Just like you can send PPP, SLIP, VT-100, VT-220,
X-25, etc, ect over your modems v.34 protocol).

"MDC4800" is just concerned with delivering the data, just like
your modem's protocol. It does not care what the receiving device
does with, or how it displays, the data. That is up to the
writers of the software.

It seems that each agency has it's own format, screen codes and
control characters. Each system seems very different. You would
have to find out what type of hardware/software is being used by
the particular agency.

Clear as Mud? ;^)

5015. Re: CA-Earthquake emergency freqs?

Newsgroup: rec.radio.scanner
Date: 1997-03-13 00:00:00 UTC
From: grohe@galaxy.nsc.com
Message-ID: <3328cee4.9757104@139.187.128.43>
Source record: 204236

On Wed, 12 Mar 97 03:45:00 GMT,
in the newsgroup rec.radio.scanner,
frog200@nospam.juno.com (Ed G.)
from West Coast Online's News Server - Not responsible for
content thoughtfully posted:

> Scott, I would recommend 640 KHz.... a local radio station!

640 is KFI in LA! I do not think LA cares much about Daily City's
M3.5 rumblers.

Try 740KHz or 810KHz, or 95.7MHz, right after a "shaker". They
tend to make a big "fuss' over any earthquakes.

The Local PD/FD channels are as good as anything else. Usually
after a sizeable "shaker", the FD's will go out and inspect dams,
bridges and overpasses. Other than that, nobody really gets very
excited.

Actually, an interesting emergency frequency, if you have a
packet TNC, is 450.0375MHz.

This is the EDIS digital emergency broadcast channel. Various
emergency agencies (OES,NOAA,USGS,FEMA,etc) can transmit
emergency "bulletins" to the Media and local public safety
agencies. The transmission is a standard 1200 baud "ham radio"
type packet transmission.

See these pages for more info:

http://www.races.sandiego.ca.gov/edis/
http://www.vgl.ucdavis.edu/~yars/edis.html

The "bulletins" are also available on-line at:

gopher://oes1.oes.ca.gov:5555/11/edis.msg

The transmitter is located on Mt. Diablo and is fairly easy to
receive, but it does not transmit very often (other than the
morse ID every so often). There is a daily system test at 10:00
am.

The bulletins are submitted by various agencies, like NOAA/NWS,
OES, USGS, FEMA and even local PD/FD's. During the recent storms
and floods, the channel was very active. During "calm" weather,
it is very "boring" (nothing but daily tests).

Among with the various NWS weather alerts, the USGS sends their "preliminary, computer generated" seismic reports over this system after a significant earthquake. Unfortunately, the Daily City quakes were not big enough to trigger the system.

BTW: The latest quake data can be read at:

http://quake.wr.usgs.gov/QUAKES/CURRENT/current.html

The details on how to set up the receiver are left up to the individual as a learning exercise (hint: www.altavista.com and "TNC"). There are plenty of Ham radio sites showing how to setup a TNC (you only need the receive portion).

5016. ubc200xlt mods

Newsgroup: rec.radio.scanner
Date: 1997-03-13 00:00:00 UTC
From: ian coulter <ian.coulter@dsto.defence.gov.au>
Message-ID: <33275FEE.7252@dsto.defence.gov.au>
Source record: 204237

Is there any mods to the 200xlt that will allow the scanner to
receive the freqs between 174Mhz and 406 Mhz. Some of these freqs are
used by the Aust Air Force and would be usefull at Air Shows.

Thanking you in anticipation

Ian

there are several places where you can get this info on the net :

gldfs.cr.usgs.gov (USGS NEIC/NEIS world-wide)
andreas.wr.usgs.gov (Northern Cal.)
scec.gps.caltech.edu (Southern Cal.)
fm.gi.alaska.edu (Alaska)
seismo.unr.edu (Nevada)
eqinfo.seis.utah.edu (Utah)
slueas.slu.edu (Central US)
tako.wr.usgs.gov (Hawaii)

don't know if they have URLs. I access them differently :

finger quake@gldfs.cr.usgs.gov
finger quake@andreas.wr.usgs.gov
finger quake@scec.gps.caltech.edu
finger quake@fm.gi.alaska.edu
finger quake@seismo.unr.edu
finger quake@eqinfo.seis.utah.edu
finger quake@slueas.slu.edu
finger quake@tako.wr.usgs.gov
finger quake@geophys.washington.edu
finger quake@eas.eas.slu.edu
finger quake@scec.caltech.edu

have fun. :)

I can just imagine what the scene would look like when the game officer catches up with you while you are riding on the back of a deer waiting for that blasted burst transmitter to go off! (It's going to be tough to get a frequency reading on a burst transmitter isn't it?) "Honest officer, (with antenna bent around your neck from the branches hitting you in the face) I was only trying to find the frequency of the transmitter!".....You exclaim as they load you into the van in your nice, shiny, new jacket that your hands are nicely tucked away inside of. :-)

When I was in my two year program at Williamsport Community College, one of the guys built a receiver for game transmitters the local game officers were using. This unit was specifically built for the local game officers to use themselves. I sure wish I could remember the specifics about it! The prof said to actually try "hunting" some of his students with the collars on first instead of just putting them on the pheasants and letting them go. Of course the game officers ignored him and stuck the collars on the pheasants and let them go. I never did hear if they found any of the pheasants or not. I can still remember the prof shaking his head and saying they were going to lose the transmitters because they had never tracked anything. Oh well, shit happens.

Hey Bob,
I've got 2 WS1000 and love them !
They run forever on 2 AAs.
I take on with me to the gym,
if I want FM radio or CB or HAM or whatever its there .
Can't beat the size
Audio is weak for outdoor listening but headphones fix that
I use my 2" antenna from my scout and throw it in my shirt pocket
I don't really have any complaints except lockout while scanning isn't available
I bought both of mine used off the net for about $400 each.
My next expenditure is cases for them.
email me any questions.

I was on Santa Monica Pier when this all went down,
Had my scanner and was listening to TV, When I heard
the news I started scanning.... I agree to the fact
they were looking pretty hard for a 3rd person. Also
there was alot of activity about a supposed bomb/package
that was left on the street nearby. The bomb squad
went in but no bomb. Boy LA was a fun town.
The night I got there 11/27 there was a high speed
chase of a van that I picked up on as I sat in LAX,
Then I drove by a house and saw a naked woman standing
in the front window of her house admiring the street.
I saw men kissing men, I saw woman kissing woman ,
there was the bank robbery, I saw more bums then I
could imagine, I can't recall all the crazies crusin
venice beach, I saw more BMWs than physically possible,
I paid $6 for a coffee and danish, anyhow ....
LA was a fun place to VISIT.

>

Unfortunately, according to the USA Electronic Communications Privacy Act
of 1986, (being later, this law supercedes the 1934 act), you may not
listen to cellphone conversations. Listening is a crime, whether or
not you divulge it, use it, etc. Of course, recording it or telling
someone else what you heard makes it more likely you'll get caught or
convicted. I think the laws have wording to the effect that the intended
recipient of the message can listen to calls intended for him. (i.e.
It's not illegal to use a cellphone to receive calls intended for you.)

Either ECPA 1986 or some later laws added cordless phone calls to the list,
as well as anything "encrypted" or "scrambled", and some other vaguely
worded restrictions. Once again, listening is a crime, not divulging
what you hear.

For the same $100/hour, a junk emailer could hire an attorney to defend themselves against you, and have the enjoyment of seeing you get all bent out of shape to boot.

Unfortunately for for you (and not-so-unfortunately for those of us who are tired of "professional victims" just begging for a fight), the burden of proof is on you to demonstrate the junk email was unsolicited. In states where the code you cite is a criminal, not civil, code, you would have to actually report the "crime" to the police and hope the state's attorney is willing to prosecute. This is one situation where the complexity of the legal system is actually beneficial.

I'm sure the cops will stop chasing muggers, murderers, rapists, & scumbags and race over to your house with lights-a-blazin' to take your report.

Take a laxative, pal. Yeesh!

Howard, someone has scanned in a large number of patents.
I'd suggest trying the 'ibm patent server', going to the
'search by patent #' page, and typing in the above patent number.
from the abstract page, you can click on a button to get scanned
images of the actual patent at various magnifications.

and the main URL is:
http://patent.womplex.ibm.com/
for query by patent number: http://patent.womplex.ibm.com/patquery.html
and for one of the above, you can jump directly with:
http://patent.womplex.ibm.com/details?patent_number=4692945+

Having done that myself, I'm still curious about command coding
details that are not mentioned in the above patents....

any one out there with more info?

Hi, Rob:

I'm not sure about the Goodyear Blimp, but you might want to try the following three frequencies:

1. 123.025 This is a air-to-air freq and all sorts of helos, from PD to media can be heard there.

2. 154.830 LAPD Tac-one. Mainly used for simulcasting "Hot shot" (priority) calls, but you can also hear LAPD helos on here talking to each other and to dispatchers.

3. 470.9125 If the LASD is your bag, try this one for their Air Unit.

Hope that helps.

5031. ## performance and range reduction of handheld scanner when used within a car

Newsgroup: rec.radio.scanner
Date: 1997-03-13 00:00:00 UTC
From: techno@actcom.co.il
Message-ID: <E6ztnx.Ey7@nonexistent.com>
Source record: 204252
Cross-posted to: alt.radio.scanner,alt.radio.scanner.uk,rec.radio.scanner,sci.electronics.design,rec.radio.amateur.antenna

Hello all readers of this newsgroup,

I was wondering whether there is a noticable range degradation when using a handheld scanner from within a car (I normally place it in a mount on the front dashboard, quite close to the front windscreen), compared with standing in the open, due to car windows absorption and car metal frame. I'm comparing apples with apples i.e. same builtin antenna. My gut feeling is that the glass shouldn't absorb much, but maybe I'm wrong. How much would a standard glass mount cell antenna improve typical range? Any knowledgable feedback would be truly appreceated.

5032. # Anyone know the Uniden BC-3000XLT???

From: Don Medine <bumper09@ix.netcom.com>
Message-ID: <01bc2fe1$02a2c4e0$7c3e5dcf@bumper09.ix.netcom.com>
Source record: 204255

I am a police officer and have a communications business. I sell Ear-Pieces for portable radios and scanners. The equipment I sell has been tested for reliability, etc...

Please email me with you name, address, email address, telephone number, etc... if you would like further information or pricing.

The ear pieces I sell consist of a coiled clear audio tube with a fitted ear piece. These are often worn by news-casters, Secret Service Agents, etc... There are other variations available.

I have used these communications devices for the past three years as a patrolman. They work great, especially when you don't want to compromise your position with a noisy radio or when you are listening to communication in an area prone to ambient noise. You see, once the ear-piece is plugged into your radio or scanner, the external speaker is deactivated.

Complete unit retails for $100-$130. I offer then for around $75.00.

Agencies are also invited to inquire.

Thanks,
Don Medine

Please, was your R10 capable of listening to short wave broadcasting ?
Could it listen to BBC, Voice of America and similar stations between
3 and 30 Mhz?
How did it perform in this portion of radio wave spectrum?
I should like to listen them on various short wave bands during the
day, and not only by night using medium waves like i am doing now.
I hope to find the right receiving short wave band almost every hour
or so.
I know that a base model performs better, but i should carry it with
me during the day to improve my understanding of spoken English.
Thankyou for any suggestion, and good listening !
Roberto Ciuffoletti

Does anyone know how to make a Nokia Model 100 cell phone go into scan mode? I've checked all the usual repositories of knowledge on this sort of thing and ran a few web searches. I turned up lots of into on Motorolas and others, but no Nokia model 100s.

This is a concern I have also.
In the past I have owned Uniden
scanners and found
them practically unusable for monitoring
800 MHz trunked communications,because
of cellular stomping all over the trunked frequencies!!
gRRR,not impressive!

And I live MILES from the nearest cell. tower!

Yes, you can modify a BC9000XLT.

See the Scanner Equipment column in June 1996 Monitoring Times
magazine for modifications & tips for the Uniden/Bearcat BC9000XLT.

Note: Reprints of Monitoring Times articles are available
for $2.00 each (plus self addressed stamped envelope) from
Grove Enterprises, 7540 Highway 64 West, Brasstown, NC
28902, tel. (800)438-8155. I wrote the column but I don't
receive any part of this $2.00.

Actually these are not the Car to Car frequencies. These are the
city-wide for dispatch and city wide informaiton.

There are some frequencies that they use to talk to each other (i think)
with out going through dispach. Let me know if I'm wrong, but these are
outside of the zone 1-13 and city-wide 1-7 frequencies.

> http://www.qsl.net/n2mca/
> Hallo Rich,
I've read your artichle in this site. Very good piece of work, perfectly
focused and unbiased. Formerly owner of an IC R1, since one month I own
an IC R-10 and I've already written many things (good and bad) about it
on this newsgroup. In your review everyone can see a complete and compact
"compendium" of what this radio is and what it can offer to its users.
I just would add to your "to do list" 2 items that, in my opinion, are
really annoying and whose improvement could be easily implemented in a
firmware upgrade.

a) To allow the user to easily read the alpha name assigned to a memory
channel when the scanner stops on a signal. It can be done, for example,
letting the name appear for two seconds, and then the S-meter replaces
it. Another possibility is to let the name appear by pushing, either
while scan is running or stopped on a signal, the MONI or the Function
key. Both keys can keep the actual function, and additionally the display
will show the channel name instead of S-meter as long as one of them is
pressed.

b) To enable the user choice if to clear or not the bank Q before starting the Auto Memory Write Scan. An alternate possibility is to let the user choose which bank has to be the target bank (no matter if 50 or 100 ch sized, it would be a big improvement anyway!). Indeed Auto Memory Write Scanning is a powerful hunting tool, but the lack of one of these two possibilities forces the user to start it and to hope he/she will never stop it, unless he/she has enough freetime to save in another bank all the previously discovered frequencies.

In my opinion, most of the desired firmware improvements could be made possible by simply empowering the SET menu, that actually is extremely poor. A problem is what we should do with our radios when (and if) Mr.Icom-san will decide to release a new CPU version.

Ciao/73 de IW9ARO - Giovanni.

I have 2 Icom R7000 receivers for sale. They cover 25-1000 and 1025-2000 MHz, including FULL 800 Mhz. Both are in excellent condition, and include the original boxes and manual. The first unit I bought new, and it also has the optional 12 VDC kit and the optional speech board, and the discriminator output has been added. The second one does not have those options. I've been asking $875 and $825 for them plus shipping. Send me a REASONABLE offer. Thanks.

The computer interface is handy when it comes to programing and keeping a
record of the 1000 channels the AR8000 has. I would hate to have to
reprogram all the channels should they be lost (ie. the radio needed a
repair).

Hi

I am in the UK and have recently purchased one of the above uniden bearcat twin turbo scanners, I had no manual given to me by the seller.

Could someone kindly give me a run down on the way the thing works, I do know how to enter frequencies but that is about all, I know nothing of any of the other facilities or how to increase or decrease the value of the frequency steps etc, if any one has a manual as long as it is not too big I would gladly re-imburse any photocopying and mailing expenses, if, you can help please e-mail me, I am getting quite desperate as nobody over here seems to know anything about them.

Kind regards and TIA
Paul

> triple conversion...

As a rule of thumb, the more conversion stages you have the more
selective
a receiver will be. Consequently, the more conversion stages you have
the
LESS SENSITIVE a receiver will be.

> does duel receive images better than the
> triple...

Dose double-conversion receive more images than a triple? In a scanner
the
answer is YES.

and is their such a thing as a single..the man at the shack
> didnt seem to know...

Radio Shack is a Marketing Company. The people who work at them are
almost
NEVER technical.

As far as single conversion. Yes, there are many receivers that are
single
conversion. Particularly SSB recievers. When it comes to SSB, there is
no benefit to having multiple conversion stages. The filtering is so
sharp
in a (good) SSB receiver that you don't need additional stages to
"shape"
the RF passband.

as i was admireing their 1.3 ghz ..best hand held

Jerry, in the US Radio Shack doesn't sell any scanners capabale of
receiving
Cellular Telephones.

Cheers!

Hi,
I am wondering if anyone knows where I can get a nickel metal battery pack replacement and a drycell replacement pack. Any suggestions? SHould I just buy the NiCad pack remove the cells and replace with NiMH cells? What are some reputable battery houses that I could contact?
Thanks for any help.
Dave Bryndal
BTW I posted the 200klt mods check them out.

First off, what freqs. do you want to monitor? Max. signal strength
appears to be your #1 concern, so if you intend to monitor frequencies
much lower than 900 MHz (?) you might be better off with something other
than a cell phone antenna.

Speeding up the scan/search rates for the Uniden BC-200/205 XLT
You will need a small crystal or ceramic resonator in the 600-800
kHz range.

1. Disassemble the unit to access the microprocessor area.
a. Slide off the battery pack.
b. Remove the two screws from the rear of the scanner and the
two screws that hold the battery retaining spring at the
base. Then remove the spring.
c. Carefuly pry the bottom of the rear cover from the scanner
and remove the cover.
d. Locate the two small screws at the base of the circuit board
and remove them. Gently pull the front panel from the main
frame at the base and separate them. If you separate them
between the two layers. Remember that for later reassembly;
the pins will have to be lined up perfectly before you slip
the sections back together.

2. Search around the logic/CPU board (Uniden calls it the "MICOM
PCB Assembly"), and locate Y-201, which is a little rectangular
component. This is the stock 400 kHz resonator. Your
replacement can be a bit larger if necessary, but not grossly
so.

3. Carefully desolder and remove Y-201. Put it in safekeeping
because you may want it for something else someday.

4. Install (solder) your newly procured replacement clock
resonator, be it a crystal or another ceramic resonator, where
Y-201 came out.

5. Reassemble: Insert top of the front panel into the slot under
the volume/squelch control panel. Carefully noting the alignment
of the dual in-line connector at the bottom of the board with
the mating socket, press the front panel firmly into place. Be
sure that the holes at the bottom of the circuit board line up
two screws and tighten them

6. Replace the rear cover by inserting the top of the cover into the slot under the VOLUME/SQUELCH control panel. Press cover into place. Insert and tighten the screws.

7. Reposition the battery retaining spring (slotted side toward notched hole). Insert the two remaining screws and gently tighten them.

8. Slide the battery pack into place. Switch scanner on to ensure that the display comes on. If not, the battery may be discharged or the dual in-line connector may have been misaligned during reassembly (step 5). Another possibility would be that the new resonator either doesn't work, is unsuitable, or may have been incorrectly installed. Another possibility (if you installed something greater than 800 kHz is that it's just too fast.

Assuming that the display comes on, leave the antenna disconnected, and run a speed test. Speed in channels-per-second equals the number of channels divided by the time in seconds. Using a Murata-Erie 800 kHz

Note that the channels must have frequencies programmed into them. "Empty" or 0000.000 MHz channels run faster and throw off the calculation.

In addition to the shortened delay time, the user reports that the panel lamp will "time out". Doubling the clock frequency halves the "light on" time. There is a variable extended delay modification in the "World Scanner Report", to large to duplicate here. Also, in Volume 1, Number 4, Bill Cheek reports that the UC-1147 CPU has the necessary large chunk of memory on board, so you're stuck with 200 channels. You can get the WSR from:

COMMtronics Engineering
PO Box 262478
San Diego, CA 92196

The Scanner Modification Handbook I and II are available from the same address. They're something like $17.95 each + $3 P&H. The WSR is $25 per year.

NOTE : I am not responsible for anything that goes wrong. Note that this

Here's some mods to help remedy the 200XLT's low battery indicator/blank out feature, courtesy of Bob Parnass:

BC200XLT LOW BATTERY FIXES
Troy T. Pummill, N6XMV

Here are two small articles from MT. I have not tried these mods, do so at your own risk (i.e. your milage may vary).

From Monitoring Times
Bob's Tip of the Month
May 1990, page 98

BC200XLT SHORT BATTERY LIFE SOLVED

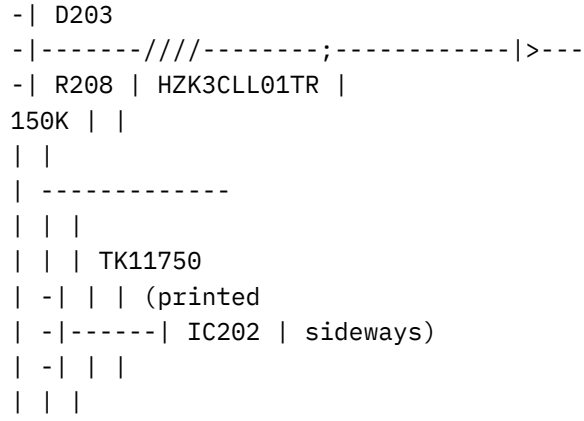
Short abttery life--sometime only an hour or two between charges--seems to be the only major complaint amoung owners of the laeading hand-held scanner, the Uniden Bearcat BC200XLT. Presumably, owners of similar sets like the BC100XLT BC205XLT, and Cobra 4030 could have the same problem. Now that is an ailment of the past.

It turns out that the batteries were not really at fault; a zener diode which determines the voltage at which the low-battery indicator would come on was defective in some units, causing the circuit to actuate prematurely. Replacing that idode and changing the value of an associated resistor provides the answer.

FREE FIX

MT contacted Uniden and was assured that they will provide the fix for free, even if the radio is outside of the one-year warranty period. If your Uniden BC200XLT suffers from short battery life, send the radioo along with a brief note describing the ailment, to Uniden Customer Service, 9900 West Point Drive, Indianapolis, Indiana, 46250.

As shown in the accompanying diagram, zener diode D203 and resistor R208 are the parts in question. D203 should be about 7 volts and R208 should be 150,000 ohms. These are miniature surface-mount devices on double- sided circuit board; if your radio is under warranty, attemping this fix yourself will void that warranty.



| | |
| ---
|
|
|

SHORT CUT

Mark Machcinski of Wyandotte, Michigan, came up with hisw own solution. He simply soldered a wire bridge across diode D203, disabling the low battery indicator entirely. The radio now operates uninterrupted until it blanks out when the abttery level drops to about 4.5 volts.

Yet another suggestions from a Canadian reader would bridge the original diode with a 6.8K resistor, defeating the premature recharge signal, yet preventing the battery from too low a discharge.

From MT
June 1990, page 98
Bob's Tip of the Month

BC200XLT BATTERY LIFE EXTENSION: Part II

Every time we run a helpful hint on a popular product, someone find an even more helpful hint! This one disable the low battery cutoff circuit and adds several hours of operation to a single charge. Our lab unit was still going strong after seven hours straight! Uniden will provide the fix for free, but if you're in a hurry and don't mind voiding your warranty, read on!

NOTE: This modification should not be attempted by anyone unfamilier with small circuit oard components.

The tools: You will need a small Phillips screwdriver, fine-tip soldering iron and solder wicking braid.

The procedure: Remove the battery pack, then the two screws form the bottom spring clip. Carefully pull the rear cover off, bottom first. Remove tjhe two small screws at the base of the circuit board. Pull the front panel away from the mainframe, bottom first.

At the bottom of the remaining board--to the left of the speaker magnet--are two blue electolytic capacitors; just above them are two striped components-- one resistor and one diode. Using the soldering iron and braid, carefully remove the two components without overheating the board or damaging the copper traces.

When you reassemble the radio, be very carful to note the insertion of the front panel into the slot at the base of

the volume/squelch panel. Be especially careful to align
the screw holes perfectly, allowing the two rows of fine pin
contacts to mate correctly with the socket. If this is not
done correctly (and it probably won't be the first time!) no
damage will occur, but the scanner display will be blank.

Recharge your batteries after 6-8 hours of heavy use. If
the scanner dies, recharge it as soon as possible to prevent
loss of your memorized frequencies.

Newsgroups: alt.radio.scanner
From: interpol@casbah.acns.nwu.edu (Interpol)
Subject: Uniden Bearcat 200XLT Cellular Restoration Mod
Message-ID: <1992Mar13.190511.16655@casbah.acns.nwu.edu>
Sender: interpol@nwu.edu
Organization: Northwestern University, Evanston, Illinois
Date: Fri, 13 Mar 1992 19:05:11 GMT
Lines: 105

Yet another Uniden/Bearcat 200XLT modification, courtesy of Bob Parnass and other good people:

BC200/205XLT CELLULAR RESTORATION

Note: It is unlawful to monitor cellular telephone conversations. It is possible to monitor signals from the deleted ranges even without conversion. Simply add 21.7 MHz to the deleted frequency and enter the higher (image) frequency. Reception is virtually identical in strength to that which would be
heard on the deleted frequency.

The frequencies deleted at the factory may be restored, but the procedure must
not be attempted by anyone unfamiliar with electronic circuitry. Grove Enterprises assumes no liability for damage caused by this procedure. The modification will void your warranty.

TOOLS REQUIRED: Small Phillips screwdriver, small wire cutters.

1. Slide off the battery pack and remove the antenna from the scanner.

2. Using a small Phillips screwdriver, remove the two screws from the back of the scanner, the two screws which hold the battery retaining spring at
the base and the spring itself.

3. Carefully pry the bottom of the rear cover from the radio and remove
the cover.

4. Locate the two small screws at the base of the circuit board and remove them. Gently pull the front panel from the mainframe at the base and separate them.

5. Locate the (64 pin quad flatpack) microprocessor IC labelled "UNIDEN
UC-1147" and the 10k ohm (brown-black-orange) leadless resistor positioned above the letters "DEN" on the IC.

6. Using miniature wire cutters, cut the resistor body in two without disturbing anything else near it. If the left solder pad comes loose, it

may be
peeled from the board. Brush or blow away any residue. This completes the
restoration.

REASSEMBLY

7. Insert the top of the front panel into the slot under the
volume/squelch control panel and, noting carefully the alignment of the dual
inline connector at the bottom of the board with the mating socket, press the
front panel firmly into place. Be sure that the holes at the bottom of the
circuit board line up with the holes in the plastic standoffs below them.
Insert the two screws and gently tighten them.

8. Replace the back cover by inserting the top of the cover into the
slot under the volume/squelch control panel; press the cover into place,
insert
and tighten the screws.

9. Reposition the battery retaining spring (slotted side toward
notched
hole), insert the two remaining screws and gently but securely tighten them.

10. Slide the battery pack into place; switch the scanner on to make
sure the display comes on. If not, the battery is discharged or the
dual-inline
connector was misaligned during assembly (see step 7).

Assuming the display comes on, press: MANUAL, 845.0, E; within two
seconds, the
frequency 845.000 should appear on the display.

Here's the last of the 200XLT mods I know of...downloaded off of a local BBS
here in Chicago:

Modification for Putting BC-220XLT In AM Reception Mode

I have come up with a crude mod for the BC200xlt scanner to allow AM
reception in the 136 to 174 range. Why would I want AM in this range you
ask? well I attend several Air shows during the year and the Thunderbirds
use 140 mhz area fregs. As we all know the Uniden switches to FM in this
range, causeing very distorted reception (slope detection). Somebody else
may have already thought of this idea (you?) but here goes. Break the AIR
Trace between dual diode D31 and IC1 pin 8. Connect the center of a single
pole - double throw mini switch to the trace leading back to IC1 pin 8.
Connect one of the other poles to the trace leading back to D31. This is the
"Normal" mode(This just restores what you have cut). Now connect the other
pole to the VHI (VHF HI) line at a easy to locate point. This is the "AM"

mode. What will happen now is when AM is selected the VHF and VHF air band will all be in the AM mode. UHF and others are not affected. When in the normal mode everything is just like it always was. I have done this mode over a year ago so it's still a cloudy in my memory. But it works like this: The microprocessor sends a high to Q7 to select the AIR mode, by routing the VHI signal around D31 by means of the switch the AM detector is reselected. Normaly D31 blocks out the VHI signal allowing FM in the VHF HI range. I hope my explaination of this mod is clear. It does take some delicate surgery to do. I also hope I haven't duplicated anyone elses idea.

Thanks

AT&T #9120 - - - - - 902.0 - 905.0 & 925.0 - 928.0 MHZ
OTRON CORP. #CP-1000 902.1 - 903.9 & 926.1 - 927.9 MHZ
SAMSUNG #SP-R912- - - 903.0 & 927.0 MHZ
==========
Note that only the panasonic can be heard, the others are digitals or
if they're in the clear you won't catch them because they are
spread-spectrum. Some are both spead-spectrum and digital.

Please I cannot answer ?'s on these I just found them and thought that
they would be of interest.
Dave

I suggest you try the following:
1. Any McDonalds drive thru frequencies
2. Any frequencies license to whore houses in the area
3. Any frequencies used by the Chinese Government
I would also suggest that you monitor the local fire department
frequencies because he may set off some alarms when he starts to blow
smoke up your ass.

Brian Mileshosky, N5ZGT (n5zgt@swcp.com) wrote:

: Doppler is good until you start messing with multi-path (Where the
: signal is bouncing all over the place). That is when a regular beam
: and radio setup might be better.

Doppler has a bunch of other problems. This is NOT intended to discourage anyone from using doppler, just to recognize its limitations. Credibility check: I helped design the AN/SRD-22 doppler direction finder for Intech Inc for use by the US Coast Guard in approx 1975.

1. A doppler DF can only display the direction of *ONE* transmitter. If there are any other sources of signal (reflections, other xmitters, adjacent channel junk, computer noise, synthesizer spurious signals, harmonics of clock oscillators, ignition noise, images, etc) the reading will be erronious. Reflections is the real killer. A ground bounce mixed with a direct signal will yield horrible results. (Incidentally, the reason most dopplers have rather large antenna ground planes is to reduce ground bounce).

2. Switched doppler is susceptable to switching noise which acts as modulation sidebands. These sidebands (harmonics of the switching frequency) will cause strong adjacent channel signals to mangle the bearing. The typical "Roanoak" design is highly susceptable to this. Doppler Systems uses DGFet switches which have a much "softer" (less rise time) switching characteristic. Intech used a modified sine wave drive to literally modulate the PIN diodes instead of switching. It totally eliminated the problem, but sensitivity was reduced. PIN diode matching was very critical.

3. The typical vertically polarized doppler system does not work well with horizontally polarized signals. Building a horizontally polarized doppler is no major challenge, but nobody seems to have done it.

4. Doppler is sensitive to fox frequency. The doppler receiver measures the phase shift from the antenna to the FM demodulator. Any change in receiver system phase shift appears as a substantial directional error. The worst error is caused by the crystal IF filter. The phase shift from IF center to filter edge goes through radical phase changes. An AFC (automagic frequency control) is manditory to keep the signal in one place on the crystal filter curve.

5. Doppler is sensitive to rotation frequency and FM demodulator distortion. There two schools of thought here. Doppler Systems uses about 300Hz rotation frequency. This is good for insuring that the signal will remain in the IF bandpass (no AFC) but results in harmonics of the 300Hz in the bandpass. These harmonics cause bearing errors and linearity (approximation of a circle) errors. The typical commutating audio bandpass filter will not remove harmonics.

Intech elected to use 4.1KHz. Most of the harmonics are outside the IF bandpass. Combined with the PIN diode modulation technique, this yielded a very low distortion sine wave at the demodulator and very good linearity. However, the group delay (phase shift error) of the IF crystal filter was far worse at the edges (+/-4KHz) than it was near the center (+/-300Hz). AFC became manditory.

It turned out that the conventional balanced multiplier FM demodulator was also slightly sensitive to signal level. Since the AN/SRD-22 was both an AM (121.5 aircraft) and FM (Marine VHF band) receiver, an ALC (automagic level control) was used. There error here is not large and can be probably be ignored.

6. Doppler is sensitive to modulation audio. The response time of the doppler DF is totally dependent upon the Q of the doppler tone bandpass filter. The wider the bandwidth, the faster the DF. If you make the filter too narrow, it takes forever to get a bearing. However, too fast and FM audio modulation and fox tones will leak through the filter and mangle the bearing. One favorite trick is to use a 300Hz fox tone to mess up the Doppler Systems DF'ers.

7. Doppler antenna patterns are very sensitive to nearby antennas and reflections. The AN/SRD-22 had to be mounted at the very top of the mast. Unfortunately, almost every other piece of electronics equipment wanted to be in the same place.

On the roof of a car, the AM/FM antenna and other radio antennas create horrible errors. Nearby antennas from other hunters at the starting point will mutilate the pattern. This is why the DF book says (several times) that the ONLY way to get a decent bearing is while moving. Moving tends to average out these errors. While the error at a given location may be severe, a few feet away might be perfectly acceptable. The trouble is you have no idea where there is a reflection free location. Moving while DFing is the only way.

73 Magazine carried a series of articles in the HomingIn section based on rotating yagi and quad antenna direction finding. This is basically an AM (signal strength) system. The difference is that you can easily see multiple transmitters, recognize reflections (they tend to blurr), do NOT require an AFC, and have an easily controllable antenna pattern (using boresight calibration). However, driving down the

freeway with a spinning 4 element quad is a great way to
attract the constabulary. Short transmissions are also
difficult to see. Equipment complexity is about the same.
Having dealt with doppler professionally and recognized its
limitations, I'm partial to a rotating antenna.

One place where a rotating antenna is far superior to doppler
is tracking a jammer. With a jammer, you have *TWO* signals
on a frequency (the person trying to talk and the jammer).
A doppler DF will yield a bogus direction because of the two
signals. A rotating antenna will show both.

I hope this helps. If there are any questions, please email.

I am most interested in hearing low VHF signals (California Highway Patrol). I am using a Pro 62 handheld with the stock rubber antenea but I can't seem to hear any CHP except dispatch and patrol cars that are very close, so I dont get much action.

Would I benefit by replacing my stock antenea with an external multi-band or the like?

Matt

Yes, the cure is to replace the stock MuRata CFWM455F (5 Khz)
455 Khz IF filter with a slightly wider CFWM455D drop in
replacement, which has a passband of about 6.5 Khz and cures
the clipping on cellular and AM aircraft as well.

Happy scanning to you blokes o'er there in the UK!

>Bruce P.

Bruce,

Shortwave reception is fair, but too much antenna will overload it easily. I tried using my Butternut HF6V, but it overloaded badly from nearby MW transmitters. So here's what works good for me, I use an Industrial Communication Engineers model 112-2 receive only amplified splitter that gives about 3-5 db gain. I use about a six foot wire antenna with the amp/splitter that is located here in the shack. This provides useful signals without overloading.

Another approach is to buy an extendable whip like the Radio Shack center loaded scanner antenna (20-006) which improves reception on lower frequencies. While it's not made as a shortwave antenna as such, it provides much better reception than the provided rubber duck below 50 mhz. I can hear Monitor Radio, BBC, VOA, RCI, RNI and many other shortwave broadcasters using this antenna while out walking here in Utah where signals aren't the best. It makes a fairly good antenna, maybe someone could recommend a better one for portable use.

Hope this helps,

Jon

> not capable of picking up cell phone at all. There are converters that
> may or may not be available any longer to pick up cell.
>

Jason,

No disrespect intended, but your statement is incorrect. I have received cell phone images on my PRO-60
in the 137-142 MHz range, as I have posted on this newsgroup. I verified the exact frequency by finding
the real frequencies of the tranmissions on my R-7000. The frequencies that had cell phone transmissions
were:

138.03 MHz ----- real freq. 886.83 MHz
140.55 MHz
141.13 MHz ----- real freq. 893.13 MHz
141.76 MHz ----- real freq. 893.76 MHz

There are probably more, but these are the ones that I have verified. Of course I only listened long enough
to identify the type of transmission, and then I stopped listening, because monitoring these transmissions is
illegal.

The data in the original Huge Shootout post, which I made, came from the Police frequencies as it was happening.

My intent was to get it onto the Net ASAP, using the currently available information.

And by the way, there is still some question as to there being a 3rd robber. The real data about the affair is still being closely held by the police.

5103. More on Trunking and MDT sources

Newsgroup: rec.radio.scanner
Date: 1997-03-13 00:00:00 UTC
From: hh357@aol.com
Message-ID: <19970313034500.WAA11562@ladder01.news.aol.com>
Source record: 204370

I just got copies of the three Motorola Patents referenced by Aaron5@geocities.com in his trunked radio post.

4,055,832 - One Error Correction Convolutional Coding System.
4,159,469 - Method and Apparatus for the Coding and Decoding of Digital Information.
4,692,945 - Dispatch Trunked Radio System.

They appear to be more applicable to the Trunking issue, than the MDT area, but Aaron5 mentions the Error correcting described in the convolutional coding system covered by Pat. # 4,055,832 is similar for the MDT (but over more bits).

The first two patents above are for hardware, and the third covers (mostly) message handling and formats.

The current plan is to scan these documents, and then put them on a Web page.

We'll let you know when this is accomplished.

Source record: 204129

Hi, in reference to your listing of Cellular phone freqs/CHs, I noticed a major error here, in that the freqs/CHs you mentioned were only those of the "original" Cellular band. For almost tem years now, the complete Cellular band has covered from 869.04 - 893.970 MHz,for Base/Cell Sites and 45 MHz lower for mobile portable unites(the phones themselves).These extra freqs are sometimes referd to as the "expansion" band CHs. While at first, the use of these freqs/CHs was limited to large urban areas where Cell phone useage was highest, thus needing more CHs to support their systems, currently most if not all areas that have Cellular service make use of these additional channels. You may also be confused when you see that the CH numbers assigned to these new starts with 869.04 being CH 991. This is because the original CHs(1 - 666) were not renumbered, because it would have made older phones that only covered the original CHs obsolete, instead the newer freqs were numbered from 890.01(CH 667) up to 893.97(CH 799) and then restarted with 869.04 on up to 870.000(CH 1023). Also the way that these new freqs was split between the "A" and "B" service providers while equal in CH numbers, was a bit disjointed. The "A" freqs are 869.04 - 879.36 and 890.01 - 891.48, for voice. The "B" system freqs are, 880.65 - 889.98 and from 891.51 - 893.97 MHz, for voice.

For a more complete understanding of how Cell phone systems operate and how they can be monitored by many different types of scanners, I recommend that you take a look at my book: Monitoring Cellular Phones Is A Violation Of Federal Law. The only book on the market that is entirely dedicated to this sensitive subject. Available from DX Radio Supply and EEB. 73s DE WA1YKL

t be
>able to buy said phone remove the speech descrambler/scrambler and wire
>it into a nice radio shack box and plug your audio out into it?

I think so. The problem is, those phones are expensive. (too expensive for me anyway)
I've been trying to do the same thing with my cellular phone to decode the channel hopping and data info that goes back and forth from tower to phone, but trying to get tech help on the phones is like trying to get a Democrat to admit he did something wrong.

>something along that line. Of course I am just brainstorming. I have
>often felt the challenge to build such a thing but I dont have the $$ to
>buy the phone and tear it apart.

I think those chips are sold by MX-COM. I dont' have a price on them, but I could look up a web site for you if you want. I'm building a voice inverter/descrambler from an old issue of Radio Electronics. It's just about done. I thought I had all of the parts to it, but by the time I jammed it into a little box and found all of the parts I was back $30. (even the little projects look like they can be built in one night) bzzzzzzzzzttttttt false. I'll send you a copy of the article if you want. I don't know how it works yet though. I'll let you know after this weekend.

Hold on, hold on. Okay, maybe a possibility. However, here in
Barrie, those snazzy new 900 Mhz frequencies were exactly what I had
been hunting for. So he may try those instead, if the 450 ones don't
work... I found them on 921.9375 but others listed from that friendly
guy who offers out those fast food lists here sez also try

30.580/154.490
30.580/154.540
30.840/154.570
33.400/154.540
457.575/467.800
457.575/467.975
904.9375/921.9375

Check 'em out...I used to live near Plains & King now I hardly ever
visit Burlington....

The repeater on Disney property is 147.300 but don't be surprised to
find that you are by yourself on it. Some of the more popular repeaters
in the area are the 146.820, 146.730, 147.345 and 145.210. There are
some good helpful people on all of them. If you want to try scanning
some of the Disney freq's there is a list of them on the CFLG homepagee
at the address in the sig.

>
>George

If you mean the AOR AR8000, I measured about 16 ch/sec practical
scan rate. Some manufacturers like to specify a "maximum"
scan rate, and that can be misleading.

There can be a big difference between the maximum rate a model
can scan and the practical rate you can expect in actual use.
It depends on the firmware in the scanner.

I measured and compared the practical scan rates for various models.
(See my bar chart in this month's Scanner Equipment column
Monitoring Times, 3/97.)

From my November 1995 column in MT:

"The memory scan rate in models like the AR8000 and
Uniden BC3000XLT depends on the order in which
frequencies and modes are programmed into memory.
The scan rate in other models, e.g., the Radio Shack
PRO-2006 and PRO-60, is almost constant, regardless of
how the scanner is programmed.

The AR8000 literature boasts a maximum scan rate
of 30 channels/second, but it is more meaningful to
know the practical rate rather than a maximum rate.
Our AR8000 scans two linked banks of unsorted
VHF-low, VHF-high, and UHF frequencies
at 16 channels/sec -- slow, by contemporary standards....

The AR8000 manual recommends that frequencies within the
same band and mode be grouped in the same bank to
obtain the fastest scan rate -- an inconvenient arrangement.
We are able to attain a rate of 25 channels/sec
after programming 860.0 MHz NBFM into 50 consecutive channels,
an impractical configuration....."

Hi, I have often wondered this same question, as to finding ways to "recycle" old Cell phones for Ham use. Certainly enough of them show up at fleamarkets, at fairly low prices. In studying in internal workings of a number of Cell phones and in looking at countless service manuals in the course of activities related to my work and for hobby interests...I have found that for the most part there is a fairly limited range of "things" that you could do in terms of converting a Cell phone that would be within the scope of most(?) Hams and othr hobbyists today. Also because of the general design of Cell phones, particularly the newer ones, there is not too much to convert them to that would be of much use beyond being a novelty. One major problem is the need to make some type of computer interface(AND software) that would control some of the radio's functions, in particular finding a way to "load" the phone's PLL's with apporopriate frequency data. In almost all current phones this is done over a serial data bus. A FEW older phones I have seen use a "parallel" bus input the the PLL ICs, as seen in some old Novatel 8200 series phones. This could be used to easily program the PLL to operate on freqs up into the 900 MHz band. I ran into someone at a past Dayton Hamvention that had done this with some type phone. It would also however require retuning the VCO circuit in order for it to lock in this higher freq range. It is questionalble as to how well the phone's TX power amp would perform at freqs above the standatd

Cell range,remember a Cell phone transmits in the 830 MHz area. Even if all went as best as possible, you would only have about 3 watts of power...

While V-Link phones are NOT recycled Cell phones, they do illustrate as to how Cellular"technology" is finding it's way inot other types of products. It would be very interestng to see if there is any easy was that the V-Links can be "redone" so as to operate on specific chanels. This also applies to the possibility of "redoing" certain models of 900 MHz cordless phones... But remember their main disadvantage, like that of Cell phones is they are designed to be a "fullduplex" radio and not as a half duplex radio: Getting them to TX and RX one the same freq is more difficult.

A much better approach to some of this is that I have seen examples of where some models of GE and or EF Johnson 800 MHz commercial FM transceivers can be programmed to operate in the 900 MHz Ham band..

How nice of a response here Scott. Why didn't you tell me to fuck off and
stay out of your mailbox like you did in the email you sent me?

Tyler

PS: I already have a license to carry a handgun in PA and am going to get one
in MD. It's going to be in the CAR so when some shmoe comes up behind me and
decides my 75 mph isn't enough and he pulls out a weapon, I'm going to be
prepared to shoot back.

Then we can all listen to the police dispatch on our scanners.

Those things are for one purpose only: to keep people from poking out
their eyeballs on antennas. They have absolutely no effect on reception
at all.
Save your money. If they worked as advertised, they'd be on *all*
antennas already.

However, if you get one, you can make up all sorts of neat stories;
"Yeah, it allows me to monitor my heart rate, too."

Bill

5120. Looking for Homestead Truck Frequencies? Anybody?

THE INHERENT INSECURITY OF DATA OVER
MOBITEX WIRELESS PACKET DATA NETWORKS

TABLE OF CONTENTS

1. Introduction
2. The Mobitex Protocol
3. RAM Mobile Data's U.S. Mobitex network
4. stupid stuff
5. Humor Section - What some major companies say about Mobitex security
6. The scanner to computer interface
7. How to compile and use the attached program
8. Program listing

****
1. Introduction
****

The Mobitex wireless data network standard was originally developed in Sweden in the 1980's and successfully marketed by Ericsson. Over the years Mobitex networks have sprouted up in numerous countries around the globe as Ericsson's world wide web page (http://www.ericcson.com) points out. So no matter where you are reading this there might be Mobitex network in operation near you. If so, this posting and attached program gives you all the information you need to intercept and decode whatever information is flowing over your local system. The required equipment is easily availble - you will need a scanner radio with discriminator output, a PC compatible computer, and a simple Op-amp based audio clipping circuit of the Hamcomm or PD203 Pocsag decoder type.

The reader will find that a lot of information in this posting is geared towards one specific Mobitex network operated by RAM Mobile Data in the United States. Nonetheless, the included program has been written with flexibility in mind - with the proper configuration options set it should work with most any Mobitex system.

Finally, one may ask whether this project is really worth the effort. The answer to that question probably depends on what sort of Mobitex systems are active in reader's vicinity. And one sure way of finding that out is by getting the described decoding system up and running. At that point the authors suppose it becomes a matter of personal taste - some people might find it a most satisfyingly orgasmic experience to watch appliance repair personnel being dispatched around their town while others move on to better things. For those contemplating monitoring the RAM network: it should be mentioned that

this network uses a cellular architecture which means that traffic in
your city will probably be divided over a number of channels reducing
the number of messages you can intercept. The authors will say though
that RAM's network does have plain ASCII messages whizzing around, one
might just have to be a little patient.

****
2. The Mobitex Protocol
****

Basically we'll let an excerpt from RAM's whitepaper available on the
world wide web do all the work.

from http://www.micron.net/~rmd/press/white_paper/security.html

>

Now just a brief explanation / amplification of some of the terms:

Aloha channel access - when the mobile transmits a message it expects an acknowledgement from the base station. If it doesn't get it the mobile assumes it transmitted at the same time as another mobile so it waits a short, random period and tries again.

GMSK - This is basically the same thing as direct frequency shift keying except the waveform is filtered to take all the sharp edges off so it can fit in a narrower channel. This makes it more susceptible to noise, but hey - you can't have everything.

BIT SCRAMBLING - like RAM says, it is done purely for technical reasons, not to hide the contents of the data (but try explaining that to a U.S. court after you get arrested for violating ECPA laws). The scrambler is just a regular 9 stage shift register pseudo-random white noise generator with feedback taps on the fifth and ninth stages initialized at the start of the first data block. What if you didn't know this? The interested reader will verify that if a correlation were performed on data stream with two shifted versions of itself (just perform a normal correlation twice in a row) you can easily see that when one stream is shifted by 5 and the other by 9 bits that something special is happening. The tranmsitted data is actually correlated enough for you to directly pick out the correct shift register taps! The interested reader might also want to verify that a regular correlation using only the bit stream and a single shifted version of itself is absolutely useless. Those working on the key recovery problem for certain versions of Motorola's digital voice privacy (DVP) encryption using similar shift register techniques might want to proceed along those lines (of course there are a hell of a lot more taps to worry about).

FRAME HEADER -
For all Mobitex systems the first two bytes are bit sync:
CCCC for the base and 3333 for the mobiles.
The next two bytes are a system specific frame sync.
For RAM this will be B433.
The next two bytes are control bytes (again system specific):
FOR ram the first part gives system ID, the latter part is a status. When Bits 1 and 2 of the second control byte are zero then data blocks will follow the frame header.
The last byte provides FEC for the two control bytes.

The program detects the Frame header by matching up the bit sync, the frame sync (optional), and checking the FEC coding on the two control bytes. When the frame header is detected it will either assume that a data block is following the frame header (non RAM mode) or it checks the control byte to see if a data block follows the frame header (RAM mode). The frame sync is not necessarily followed by any data.

DATA BLOCK - the program processes the data block as follows:
undo the bit scrambling (if that option is set)
uninterleave the data
Run through the forward error correction (FEC) routine while keeping track of the number of errors.
Calculate the CRC on this data block and compare with the received CRC.
If the calculated CRC does not match the transmitted CRC and there were a large number of FEC errors the programs decides that a data block was actually not transmitted and goes back to hunting for the frame header.
If a good data block was received it will go on and try to receive another data block.

Basically then, the program cycles back and forth between hunting for the frame sync and printing out DATA blocks. The output format of the data blocks will look something like:

6F6C6F6775653A2049424D204D6F62696C65A73B ologue: IBM Mobile&#65533;;

or if the calculated CRC was bad it would have looked like:

6E6C6F6775653A2049424D204D6F62696C65A73B BAD CRC nlogue: IBM Mobile&#65533;;

The last two bytes are the CRC; the first 18 bytes are the data. Whenever you see these types of blocks appearing on the screen then you can rest assured that you do indeed have the program configured properly. Keep in mind that your system might have very little actual traffic. Also, status message will appear as single data blocks (at least for the RAM network).

If you the reader must know more then take a look a various semiconductor data sheets (example : look at the MXCOM's 909 Mobitex interface chip for a data sheet giving a lot of information on the mobitex protocol - http://www.mxcom.com/mx909Api.htm). Also, more details on the RAM system can be found in the following article:

M. Mobeen Khan, "Wireless dta over RAM's Mobitex network,"
Proceedings of the SPIE, Vol. 2601, pp. 48 - 53, 1995.

Of most interest is section 3 giving information on the network protocols. This would help one figure out the raw data blocks displayed by this program. The basic upshot - the first data block of a packet has the following format:

BYTES 1-3 : Destination Mobitex Acess Number (MAN) - tells which mobile is to receive this packet

BYTES 4 : Frame ID
BYTE 5 : Sequence number
BYTE 6 : Number of data blocks in the packet

The above 6 bytes are part of the Mobitex standard (data link layer). The next are specific to the RAM network layer implementation.

BYTES 7-9 : Sender's MAN
BYTES 10-12 : Addressee MAN
BYTE 13 : State Flag
BYTE 14-18 : Packet ID

BYTE 19-20 : CRC bytes - we're back to the Mobitex standard

The state flag can be used to send any one of 256 status messages to a specific terminal (this is application dependent). So don't be suprised to see a lot of single data blocks coming in over the air. The next data blocks (if any) are user data which can be virutally any kind of protocol. The included program does not take advantage of any of this fancy stuff - it simply displays the data blocks sent over the physical layer.

For additional "security" each device that works on the RAM network has its own serial number in addition its mobitex access number. This serial number is verified every time the mobile logs on to RAM. No doubt readers will recognize that this is exactly the same process used to provide security for cellular phones in north America. One can only conclude that the RAM Mobile Data network is similarly waiting to be abused. The attached program could potentially be used to gobble up lots of MANs and their corresponding serial numbers as part of a cloning operation. The only reason that hasn't happened yet is that cloning cellular phones is a far more lucrative proposition. However, please don't misunderstand us - we're not trying to advocate or promote any sort of illegal activities.

Conclusions: Mobitex is truly the greatest contribution to the telecommunications industry from the Nordic countries. At this point the authors would be remiss if they failed to mention the greatest contribution to humanity from this part of the globe - mass quantities of cheap and legal pornography! What telecom nerd could ask for anything more?

****
3. How to identify RAM / Mobitex frequencies
****

In the United States, RAM mobile data has built an extensive Mobitex network covering most of the larger cities. To verify RAM's coverage in your area take a look at the following link:

http://www.ram-wireless.com/coverage/coverage_main.html

Once you have verified that you are indeed in the RAM coverage area you will want to find the right frequencies. In each of these areas RAM will have obtained at least one block of 10 individual frequencies somewhere in the 935-940MHz (Base) / 896-901MHz (Portable) band (with 12.5KHz channel spacing). The specific frequencies allocated vary from area to area. If you don't have access to a frequency database one can find the RAM's frequencies by scanning for channels with the following characteristics. The transmitter is always on. When the channel is idle there will be a background information burst transmitted roughly every half second or second. The best description for how a packet sounds would be a brief burst of white noise. Between packets the carrier will be unmodulated and you won't hear a thing. This means you want to find those channels that sound like "Chuff... Chuff... Chuff..." I don't know whether other Mobitex networks sound similar - after all, one needn't necessarily keep the transmitter on all the time, one might be running at a different baud rate, and if bit scrambling is not used the system might sound less like noise.

The program options section gives a suggested procedure to follow for trying to receive unknown Mobitex systems.

As an aside, anyone who has the ability to monitor Motorola mobile data terminals using the MDC4800 protocol (using a different program available on the internet) can monitor RAM's main competitor ARDIS. Their coverage maps and more information can be found at:

http://www.ardis.com/ardis_hp/mapintro.htm

****
4. Stupid stuff
****

The program itself is absolutely free, not shareware. As such, the authors do not feel obligated to provide any support or updates beyond the information included in this text. Any attempts to personally contact the authors are doomed to failure since they have taken steps to remain anonymous.

There are no restrictions on redistribution of this text file or the program. Mangle it, rewrite it, sell it (like you're going to get any money for this in the first place), whatever... see if the authors care - that's why there giving this away for free.

If anyone has more information to add please post! Let us know of any major problems you run into. Please post to the rec.radio.scanner newsgroup - the authors are so cowardly that they do not want to admit to having regular internet access (which explains in part why this is being posted from a public terminal). Also, let everyone know if you find any active Mobitex systems other than RAM Mobile Data's and what they are used for.

Anyone archiving this information or putting it on some world wide web page will probably want to delete the following paragraph. One of the authors absolutely insisted this paragraph be included although the

others would have preferred not to.

The authors exhort anyone reading this not be a parasitic internet douche sponge requesting and soaking up information for financial and egotistical reasons while giving nothing of value in return. As an illustration, an author profile of jvpoll@dallas.net taken from www.dejanews.com uncovers his step by step progress in the past year in attempting to build a device to track and follow trunked radio systems - pleadings on the sci.crypt newsgroup for help on decoding trunked radio control channel protocols, discussions on the sci.electronics.design newsgroup on how to protect his "proprietary" code and help on hooking up a LCD display, the incessant stream of advertising and ego building on the alt and rec.radio.scanner newsgroups, in addition to postings to various alt.recovery.* and alt.romance newsgroups. An author profile from www.dejanews.com only scratches the surface - it won't reveal things like membership in the North American Man Boy Love Association (apparently child molestors try to avoid public exposure) or how thick the layers of dried up semen crusts are on Jim's trousers and commercial products (potential customers are advised to delay ordering from Jim until male impotence finishes taking its terrible toll).

****
5. Humor Section
****

For your entertainment this section gives excerpts from what two leading communication companies (RAM Mobile Data and Bellsouth) have to say about Mobitex data security on their web pages. If you don't believe these are real check out the http links for yourself.

RAM Mobile Data -

from http://www.micron.net/~rmd/press/white_paper/security.html

> The combination of digital technology and packet data switching has
> produced a high degree of inherent security to safeguard the privacy
> of users' data. The additional use of sophisticated protocols and
> unique radio modem designs make it extremely difficult to tap into
> the MOBITEX networks.

> Receiving and transmitting data over the airlink in the MOBITEX
> network is a very complicated process. It is a difficult task for
> radio modem manufacturers, not to mention much less sophisticated
> hackers trying to break into the network. It may be more cost
> effective to break into the user's computer system, rather than the
> MOBITEX network since the technical expertise needed to break into
> the air interface is so extensive.

> There are many inherent security measures built into MOBITEX and a
> wide selection of network features capable of enhancing data
> security. Unless one is transmitting very sensitive data, one need
> not be apprehensive about data security on the MOBITEX networks.

Bellsouth - from http://www.data-mobile.com/unshocked/security.html

> Mobitex protocol provides a high level of security. Data
> transmissions over a wireless packet switched network are much more
> difficult to capture than voice transmissions over a cellular voice
> network. Unlike conversations in the cellular environment, which are
> continuous and easily monitored by unsophisticated eavesdroppers,
> messages in a packet switched environment are sent in bursts.
> "Reading" such messages is only possible if the RF interface can be
> descrambled, a process requiring a level of personnel skill and
> software sophistication that is prohibitive. In addition, Mobitex is
> compatible with customer selected security packages, thus enabling
> the user to choose additional security for select messages.

Conclusions: BULLSHIT. Especially when Mobitex is a public, freely available standard. The most challenging part of this project was actually getting the Mobitex documentaion, everything else was a programming excercise. Not that proprietary protocols would have been more difficult to figure out - just ask Motorola!

Obviously the users of Mobitex networks have been lied to and raped by large corporate entities. The only real way to achieve data security over a Mobitex network is using real honest-to-god encryption. This decision is left up to each customer. The reader is invited to make an inspired guess as to how many customers actually choose to use real encryption after being told that it is virtually impossible for anyone to receive data transmitted over the radio link. The authors of this posting sincerely hopes that all those developers of portable terminals using RAM's network for credit card verification didn't listen too closely to what RAM was telling them.

The authors urge everyone to contact these companies and point out to them the error of their ways. When doing so be sure to emphasize you're reading data off a RAM's network with an el-cheapo scanner, a few dollars worth of parts from Radio Shack, and some really shitty code floating around the internet. It can't hurt to lie and tell them you're a HACKER (god forbid!) going by a handle such as 'Brunhilde' and that you're using your skills to collect dozens of credit card numbers off of RAM's network each day. Maybe then they'll decide (along with Morotola) to do something to secure their mobile data terminal systems such as bribing enough Congress-creatures to pass a law mandating 20 year prison sentences for anyone who has ever bought an op-amp from Radio-Shack (and now you know why Radio-Shack maintains a computer database of all of its customers).

****
6. The computer to scanner interface
****

The interface described here will allow you to monitor not only Mobitex systems, but with different freely available software packages you can also monitor POCSAG paging signals (PD203 package), Motorola MDC4800 mobile data terminal transmissions (just ask on this newsgroup)

decode Motorola trunked radio control channel information (see next blurb about a program called trunker.exe), and also shortwave RTTY and fax transmissions (HAMCOM and JVFAX software packages). Not too bad for a few dollars worth of parts!

------ IRRELEVANT NON-MOBITEX INFORMATION WARNING!!! ------

Some semi-new Motorola trunked radio control channel information for those poor souls palying around with trunker.exe: Those who might want to monitor 800MHz systems operating with some channels offset every 12.5KHz might want to look at my current best guess at the algorithm for converting a frequency assignment code into an actual frequency:

1. If the code is < 0x2D0 then
Frequency = 851.0125 + (0.25 * code)

2. For the remaining codes: if the code < 0x2f8 then
Frequency = 848.0000 + (0.25 * code)

3. If 0x32f < code < 0x340:
Frequency = 846.6250 + (0.025 * code)

4. If the code is > 0x3C0:
Frequency = 843.4000 + (0.025 * code)

I'm pretty sure 0x2f8, 0x340, and 0x3C0 are not frequency assigments - they define (within a spot or two) boundaries between blocks of information and frequency assignments. I've only been able to test this algorithm out on one system that used frequencies falling under cases 2,3, and 4 (anyone from the rural North Alabama or middle Tennessee areas will sympthasize with my plight) so there are no guarrantees that it works properly for every single frequency in your area. Any corrections to this information are welcome and thanks to whoever posted the right formula for 900MHz systems. And if you do post a message saying it's all screwed up include exactly which frequencies in your area aren't getting decoded correctly and maybe what this algorithm thought they were.

For those who want to send information to your scanner and have trouble configuring the serial port you will definitely want to remove the following line from the set8250 routine:

```
outportb (0x03fb, 0x00); /* set IER on 0x03f9 */
```

What this line did was to effectively undo the serial port parameter setup from just a few lines earlier.

Finally, those of you messing around with ways to tell your computer when to switch back to the control channel might want to just detect the disconnect sequence (11001010 sent at 300 baud). This works even using just your present interface (no audio is being transmitted at that time) without an additional low-pass filter section feeding into your computer just for sub-audible information. It's incredibly cheesy but you'll find it actually works.

---------- Back to Mobitex stuff ----------

Now for the really fun part - your scanner will need to be modified
to allow you to tap off directly from the discriminator output. If you
wait until the signal has gone through the radio's internal audio
filtering the waveform will likely be way too heavily distorted to be
decoded. This is exactly the same problem that our friends who like to
decode pager transmissions run into - some of them have claimed they can
only decode 512 baud pager messages using the earphone output of their
scanner. These transmissions are 8000 baud so you absolutely must use
the discriminator output. If you don't know where to begin modifying
your scanner you might want to ask those who monitor pagers how to get
the discriminator output for your particular radio.

Those of you who have already built an interface for decoding
pager messages should be able to use that interface with some possibly
minor modifications. For those people starting from scratch - you might
want to check out packages intended for pager decoding such as PD203 and
the interfaces they describe. The following excerpt gives an example of
a decoder that is a good place to start experimenting (lifted out of the
PD203 POCSAG pager decoder shareware documentation):

```
>
> 0.1 uF |\ +12v
> ---||----------------------|- \|
> AF IN | |741 \
> ---- | | /---------------------- Data Out
> | \ ------|+ /| | CTS (pin 5/8)
> | / 100K | |/-12v | or DSR (pin 6/6)
> | \ | |
> GND / ----/\/\/\---- GND ------ GND (pin 7/5)
> | | 100K
> | \ N.B. Pin Numbers for com port are
> GND / given as x/y, where x is for a 25
> \ 10K way, y for a 9 way.
> /
> |
> GND
>
> The above circuit is a Schmitt Trigger, having thresholds of about +/- 1v.
> If such a large threshold is not required, eg for a discriminator output,
> then the level of positive feedback may be reduced by either reducing the
> value of the 10K resistor or by increasing the value of the 100K feedback
> resistor.
>
> The +/- 12v for the op-amp can be derived from unused signals on the COM
> port (gives more like +/- 10v but works fine !):-
>
>
> TxD (2/3) --------------|<----------------------------------- -12v
> | |
> RTS (4/7) --------------|<-------- GND - -
```

```
> | | _ + 10uF
> --------->|------- - - |
> Diodes 1N4148 | - + 10uF GND
> | |
> DTR (20/4) ------------->|------------------------------------ +12v
>
```

DO NOT use the RI (ring indicator) as an input to the computer.

The authors strongly suggest tying the non-inverting (+) input of the op-amp to ground since you are working directly with the discriminator output and don't need a Schmitt trigger.

As an example, the authors are currently using the using the above circuit with the following characteristics:

1. The non-inverting input was tied straight to ground
2. The capacitance value was reduced to 0.02 microfarads.
3. The 100K resistor at the capacitor was raised to 2 MegaOhms
4. The op-amp used was an LF411

These changes were done primarily to reduce the loading on the discriminator output circuitry of the scanners used (one presumes the intial audio stages have high impedances). The capacitance had been reduced to 0.02uF to avoid the following problems while monitoring Motorola Mobile data terminals - when a transmitter kicked on it took such a long time for the DC level discriminator output to re-establish itself that the very first message was often cut off. In fact, when monitoring Motorola MDC4800 mobile data terminals the authors feel it prudent to revert back to a 100Kohm resistor. The moral of this story is play around and use your oscillscope to verify the interface is working exactly right!

Interface checking - use of the PD203 POCSAG pager decoding program is a good test. Additionally, the included program will tell you whether it thinks the interface is working during the startup process. This test only means that the input lines on the serial port are successfully changing states. It doesn't guarantee that your interface or scanner is suitable for 8000 baud operation.

Keep in mind that depending on your scanner and interface you may need to set the /BI:1 option in the program to invert the polarity of the incoming data.

A few words about your scanner - the receive bandwidth must be wide enough to pass the 12.5KHz wide Mobitex channel without problems. I doubt this will a problem for any scanner since they are built to receive 25KHz channels. However, if you have a narrow FM mode setting for 12.5 KHz channels then the filtering might produce too much distortion. So you might want to start experimenting with the regular setting that you use to monitor 25 KHz channels.

****
7. A Few words about the program
****

Remember - don't run this under Windows. DO NOT use control-c
unless you enjoy rebooting your computer on a regular basis (but you're
probably used to doing that with Microsoft products). To exit this
program hit any key on the keyboard. This program does not accept any
sort of keyboard input - all configurations are done with the command
line arguements listed below. An example of this would be (assuming you
called your program executable is called "mobitex.exe"):

mobitex /v:1 /cfs:0 /rn:0 /com:2

By default the program stores all received data in a file starting with
MOBYDA. Each time the program is run it picks a new filename so that
your previously captured data will not be overwritten. The program
defaults are set for operation with RAM's mobitex network (the only
parameter you might need to set is the bit inversion option which will
depend on your particular scanner and interface). The authors suggest
using a one line batch file with all the configuration information in it
for each type of system you will want to monitor.

By default, the program assumes you will be listening to a base
station, not a portable computer.

Finally, are you worried that your computer is too slow to keep up
with this mess? The very last number that the program prints to the
screen gives approximately the maximum value of how full the receive
buffer got. On the authors' systems running fast Pentiums this value
rarely exceeds 100 out of the full 15000 word buffer length.

- -
Summary and explanation of program command line arguement options

VERBOSE MODE: when enabled the program will show all received frame sync
and control bytes as they are received. You will want to set this
mode if you are examing an unknown system and want to verify that
this is indeed a Mobitex system.
/V:1 - print received system frame sync and control bytes
/V:0 - don't show the above (DEFAULT)

CHECK FRAME SYNC: If the frame sync option is correctly set for the
system you are monitoring then enable this option to better allow the
program to decode incoming data. If you don't know the frame sync
disable this option and enable the /V option to find out what it is.
/CFS:1 - check system specific frame sync field (DEFAULT).
/CFS:0 - Don't check it - useful for unknown systems.

FRAME SYNC: Each system is allowed to have its own frame sync sequence.
This option allows you to set it to whatever your particular system is
using. Once the proper Frame sync is specified you can enable the CFS
option.
/FS:XXXX - set system specific frame sync to HEX XXXX (DEFAULT B433)

BIT SYNC: The Mobitex standard specifies that this should be CCCC for
transmissions from a base station. The only reason that this is a user
option is because if you want to listen to the mobile transmissions
you must change this setting to 3333. These are the only two settings
that you should ever need.
/SY:YYYY - set bit sync to HEX YYYY (Default for base stations CCCC)

BAUD RATE: You can tell the program to run at virtually any baud rate
you want. If you don't know the baud rate of an unknown system you
probably should look at your received waveform on an oscilloscope.
/BR:Z - Z is the Mobitex system's baud rate (Default = 8000).

BIT SCRAMBLING: This option allows you to turn the bit scrambling off if
needed although the authors guess that most systems will be using it.
/BS:1 - System uses bit scrambling (DEFAULT)
/BS:0 - system does not use bit scrambling

RECEIVE CLOCK ADJUSTEMENTS: The crystal controlling your computer's
serial port might be slightly different from the author's. The current
routine will attempt to make up for this variation (within +/- 5 ns)
of the 840ns clock.
/CA:1 - program attempts to fine tune receive clock (DEFAULT)
/CA:0 - program does not attemp to fine tune receive clock.

BIT INVERSION: Your scanner and interface combination may invert the
incoming data. If so this option must be set.
/BI:1 - Inverts incoming raw data.
/BI:0 - don't invert incoming raw data (DEFAULT).

RAM NETWORK mode: If set, the program decides that a sync and control byte
sequence is followed by data blocks if the second control byte has
bits 1 and 2 zero. If not set then the program checks to see if a data
block follows EVERY sync/control byte sequence. This probably should
be set to zero for non-RAM systems.
/RN:1 - RAM only: control bytes determine if data blocks follow sync.
/RN:0 - always try to decode data blocks regardless of control bytes.

OUTPUT FILE: If you don't want data written to an output file (with a
unique filename) disable this option. This might be useful for
troubleshooting if you suspect disk access is causing problems.
/OF:1 - Write data to output file (DEFAULT).
/OF:0 - Don't write output data file.

COM PORT: Allows you to set which com port you want to use with your
interface.
/COM:z - set z = 1,2,3,4 to set com port you want to use.

- -
Suggested procedure for an unknown Mobitex system:

1. Find out the correct baud rate. Best bet - use an oscilloscope.

2. Start out with following options set: /RN:0 /CFS:0 /v:1

3. If you don't known whether you need to invert the incoming data the authors suggest the following procedure: try both /BI:0 and /BI:1 options. The correct setting will probably be the one which gets good control bytes (you don't see the "BAD Control Byte FEC" message as often).

4. You want to look at those lines with good control bytes and indentify the system specific Frame sync. From now on, when you want to monitor this system use the /FS: and /CFS:1 options to tell the program to actively check for this frame sync. If things are working reasonably well at this point you should only good control bytes appearing on the screen every time you hear some data coming over the channel.

5. At this point the only option you have left to play with is the /BS: option. You will known if the /BS: option is correctly set when you see valid data blocks appearing on the screen - they will look something like :

6F6C6F6775653A2049424D204D6F62696C65A73B ologue: IBM Mobile&#65533;;

If you see any blocks of this form then all parameters are correctly set - such blocks had to go through several hurdles involving forward error correction and a CRC check and would have not been displayed if program parameters have been incorrectly set.

6. Sit back and snarf the data. In order not to see the same frame sync and control bytes from appearing over and over you now probably will want to set the /V:0 option. Keep in mind that very little actual data may be flowing over the network you are monitoring. Because of this the authors have been known to leave their computers and scanners monitoring a specific Mobitex system all day while they are off at work.

- -

As far as compiling this - save the latter portion of this posting (the program listing) and feed it to a C compiler. Pretty much any C compiler from Borland should work. If you (Heaven Forbid) use a Microsoft C compiler you might need to rename some calls such as outport. Follow any special instructions for programs using their own interrupt service routines (my compiler package recommends turning the "Use register variables", and "stack warning" compile options off). It also does not want anything whatsoever to do with Windows. Please don't even think about running this program under Windows.

****
8. Finally - the program listing itself

5122. CHP and Morse-code frequencies

Newsgroup: rec.radio.scanner
Date: 1997-03-14 00:00:00 UTC
From: Ray Hill <rchill@qnet.com>
Message-ID: <01bc309a$b0bffc00$37219bcf@ppprchill>
Source record: 204139

Does anyone have the base station and mobile frequencies for the CHP in California's Antelope Valley? Also, is there a frequency where Morse code is often or continuously transmitted? Thanks in advance for any help.

5123. Re: double or triple conversion scanner.

Oh...definitely triple conversion is the way to go. In my area (Chicago suburbs), it is a must do to the the strong RF activity. My friend bought a double conversion RS handheld and it worked like crap. Lots of intermod, etc. I made him exchange it for a triple conversion model and his problem was gone. I wouldn't own anything else, at least not around here.

No biggie. Just my opinion.

6. The scanner to computer interface
7. How to compile and use the attached program
8. Program listing

****
1. Introduction
****

The Mobitex wireless data network standard was originally developed in Sweden in the 1980's and successfully marketed by Ericsson. Over the years Mobitex networks have sprouted up in numerous countries around the globe as Ericsson's world wide web page (http://www.ericcson.com) points out. So no matter where you are reading this there might be Mobitex network in operation near you. If so, this posting and attached program gives you all the information you need to intercept and decode whatever information is flowing over your local system. The required equipment is easily availble - you will need a scanner radio with discriminator output, a PC compatible computer, and a simple Op-amp based audio clipping circuit of the Hamcomm or PD203 Pocsag decoder type.

The reader will find that a lot of information in this posting is geared towards one specific Mobitex network operated by RAM Mobile Data in the United States. Nonetheless, the included program has been written with flexibility in mind - with the proper configuration options set it should work with most any Mobitex system.

Finally, one may ask whether this project is really worth the effort. The answer to that question probably depends on what sort of Mobitex systems are active in reader's vicinity. And one sure way of finding that out is by getting the described decoding system up and running. At that point the authors suppose it becomes a matter of personal taste - some people might find it a most satisfyingly orgasmic experience to watch appliance repair personnel being dispatched around their town while others move on to better things. For those contemplating monitoring the RAM network: it should be mentioned that this network uses a cellular architecture which means that traffic in

your city will probably be divided over a number of channels reducing
the number of messages you can intercept. The authors will say though
that RAM's network does have plain ASCII messages whizzing around, one
might just have to be a little patient.

****
2. The Mobitex Protocol
****

Basically we'll let an excerpt from RAM's whitepaper available on the
world wide web do all the work.

from http://www.micron.net/~rmd/press/white_paper/security.html

>

Now just a brief explanation / amplification of some of the terms:

Aloha channel access - when the mobile transmits a message it expects an acknowledgement from the base station. If it doesn't get it the mobile assumes it transmitted at the same time as another mobile so it waits a short, random period and tries again.

GMSK - This is basically the same thing as direct frequency shift keying except the waveform is filtered to take all the sharp edges off so it can fit in a narrower channel. This makes it more susceptible to noise, but hey - you can't have everything.

BIT SCRAMBLING - like RAM says, it is done purely for technical reasons, not to hide the contents of the data (but try explaining that to a U.S. court after you get arrested for violating ECPA laws). The scrambler is just a regular 9 stage shift register pseudo-random white noise generator with feedback taps on the fifth and ninth stages initialized at the start of the first data block. What if you didn't know this? The interested reader will verify that if a correlation were performed on data stream with two shifted versions of itself (just perform a normal correlation twice in a row) you can easily see that when one stream is shifted by 5 and the other by 9 bits that something special is happening. The tranmsitted data is actually correlated enough for you to directly pick out the correct shift register taps! The interested reader might also want to verify that a regular correlation using only the bit stream and a single shifted version of itself is absolutely useless. Those working on the key recovery problem for certain versions of Motorola's digital voice privacy (DVP) encryption using similar shift register techniques might want to proceed along those lines (of course there are a hell of a lot more taps to worry about).

FRAME HEADER -
For all Mobitex systems the first two bytes are bit sync:
CCCC for the base and 3333 for the mobiles.
The next two bytes are a system specific frame sync.
For RAM this will be B433.
The next two bytes are control bytes (again system specific):
FOR ram the first part gives system ID, the latter part is a status. When Bits 1 and 2 of the second control byte are zero then data blocks will follow the frame header.
The last byte provides FEC for the two control bytes.

The program detects the Frame header by matching up the bit sync, the frame sync (optional), and checking the FEC coding on the two control

bytes. When the frame header is detected it will either assume that a data block is following the frame header (non RAM mode) or it checks the control byte to see if a data block follows the frame header (RAM mode). The frame sync is not necessarily followed by any data.

DATA BLOCK - the program processes the data block as follows:
undo the bit scrambling (if that option is set)
uninterleave the data
Run through the forward error correction (FEC) routine while keeping track of the number of errors.
Calculate the CRC on this data block and compare with the received CRC.
If the calculated CRC does not match the transmitted CRC and there were a large number of FEC errors the programs decides that a data block was actually not transmitted and goes back to hunting for the frame header.
If a good data block was received it will go on and try to receive another data block.

Basically then, the program cycles back and forth between hunting for the frame sync and printing out DATA blocks. The output format of the data blocks will look something like:

6F6C6F6775653A2049424D204D6F62696C65A73B ologue: IBM Mobile&#65533;;

or if the calculated CRC was bad it would have looked like:

6E6C6F6775653A2049424D204D6F62696C65A73B BAD CRC nlogue: IBM Mobile&#65533;;

The last two bytes are the CRC; the first 18 bytes are the data. Whenever you see these types of blocks appearing on the screen then you can rest assured that you do indeed have the program configured properly. Keep in mind that your system might have very little actual traffic. Also, status message will appear as single data blocks (at least for the RAM network).

If you the reader must know more then take a look a various semiconductor data sheets (example : look at the MXCOM's 909 Mobitex interface chip for a data sheet giving a lot of information on the mobitex protocol - http://www.mxcom.com/mx909Api.htm). Also, more details on the RAM system can be found in the following article:

M. Mobeen Khan, "Wireless dta over RAM's Mobitex network,"
Proceedings of the SPIE, Vol. 2601, pp. 48 - 53, 1995.

Of most interest is section 3 giving information on the network protocols. This would help one figure out the raw data blocks displayed by this program. The basic upshot - the first data block of a packet has the following format:

BYTES 1-3 : Destination Mobitex Acess Number (MAN) - tells which mobile is to receive this packet
BYTES 4 : Frame ID

BYTE 5 : Sequence number
BYTE 6 : Number of data blocks in the packet

The above 6 bytes are part of the Mobitex standard (data link layer). The next are specific to the RAM network layer implementation.

BYTES 7-9 : Sender's MAN
BYTES 10-12 : Addressee MAN
BYTE 13 : State Flag
BYTE 14-18 : Packet ID

BYTE 19-20 : CRC bytes - we're back to the Mobitex standard

The state flag can be used to send any one of 256 status messages to a specific terminal (this is application dependent). So don't be suprised to see a lot of single data blocks coming in over the air. The next data blocks (if any) are user data which can be virutally any kind of protocol. The included program does not take advantage of any of this fancy stuff - it simply displays the data blocks sent over the physical layer.

For additional "security" each device that works on the RAM network has its own serial number in addition its mobitex access number. This serial number is verified every time the mobile logs on to RAM. No doubt readers will recognize that this is exactly the same process used to provide security for cellular phones in north America. One can only conclude that the RAM Mobile Data network is similarly waiting to be abused. The attached program could potentially be used to gobble up lots of MANs and their corresponding serial numbers as part of a cloning operation. The only reason that hasn't happened yet is that cloning cellular phones is a far more lucrative proposition. However, please don't misunderstand us - we're not trying to advocate or promote any sort of illegal activities.

Conclusions: Mobitex is truly the greatest contribution to the telecommunications industry from the Nordic countries. At this point the authors would be remiss if they failed to mention the greatest contribution to humanity from this part of the globe - mass quantities of cheap and legal pornography! What telecom nerd could ask for anything more?

****
3. How to identify RAM / Mobitex frequencies
****

In the United States, RAM mobile data has built an extensive Mobitex network covering most of the larger cities. To verify RAM's coverage in your area take a look at the following link:

http://www.ram-wireless.com/coverage/coverage_main.html

Once you have verified that you are indeed in the RAM coverage area you will want to find the right frequencies. In each of these areas RAM will have obtained at least one block of 10 individual frequencies somewhere in the 935-940MHz (Base) / 896-901MHz (Portable) band (with 12.5KHz channel spacing). The specific frequencies allocated vary from area to area. If you don't have access to a frequency database one can find the RAM's frequencies by scanning for channels with the following characteristics. The transmitter is always on. When the channel is idle there will be a background information burst transmitted roughly every half second or second. The best description for how a packet sounds would be a brief burst of white noise. Between packets the carrier will be unmodulated and you won't hear a thing. This means you want to find those channels that sound like "Chuff... Chuff... Chuff..." I don't know whether other Mobitex networks sound similar - after all, one needn't necessarily keep the transmitter on all the time, one might be running at a different baud rate, and if bit scrambling is not used the system might sound less like noise.

The program options section gives a suggested procedure to follow for trying to receive unknown Mobitex systems.

As an aside, anyone who has the ability to monitor Motorola mobile data terminals using the MDC4800 protocol (using a different program available on the internet) can monitor RAM's main competitor ARDIS. Their coverage maps and more information can be found at:

http://www.ardis.com/ardis_hp/mapintro.htm

****
4. Stupid stuff
****

The program itself is absolutely free, not shareware. As such, the authors do not feel obligated to provide any support or updates beyond the information included in this text. Any attempts to personally contact the authors are doomed to failure since they have taken steps to remain anonymous.

There are no restrictions on redistribution of this text file or the program. Mangle it, rewrite it, sell it (like you're going to get any money for this in the first place), whatever... see if the authors care - that's why there giving this away for free.

If anyone has more information to add please post! Let us know of any major problems you run into. Please post to the rec.radio.scanner newsgroup - the authors are so cowardly that they do not want to admit to having regular internet access (which explains in part why this is being posted from a public terminal). Also, let everyone know if you find any active Mobitex systems other than RAM Mobile Data's and what they are used for.

Anyone archiving this information or putting it on some world wide web page will probably want to delete the following paragraph. One of the authors absolutely insisted this paragraph be included although the

others would have preferred not to.

The authors exhort anyone reading this not be a parasitic internet douche sponge requesting and soaking up information for financial and egotistical reasons while giving nothing of value in return. As an illustration, an author profile of jvpoll@dallas.net taken from www.dejanews.com uncovers his step by step progress in the past year in attempting to build a device to track and follow trunked radio systems - pleadings on the sci.crypt newsgroup for help on decoding trunked radio control channel protocols, discussions on the sci.electronics.design newsgroup on how to protect his "proprietary" code and help on hooking up a LCD display, the incessant stream of advertising and ego building on the alt and rec.radio.scanner newsgroups, in addition to postings to various alt.recovery.* and alt.romance newsgroups. An author profile from www.dejanews.com only scratches the surface - it won't reveal things like membership in the North American Man Boy Love Association (apparently child molestors try to avoid public exposure) or how thick the layers of dried up semen crusts are on Jim's trousers and commercial products (potential customers are advised to delay ordering from Jim until male impotence finishes taking its terrible toll).

****
5. Humor Section
****

For your entertainment this section gives excerpts from what two leading communication companies (RAM Mobile Data and Bellsouth) have to say about Mobitex data security on their web pages. If you don't believe these are real check out the http links for yourself.

RAM Mobile Data -

from http://www.micron.net/~rmd/press/white_paper/security.html

> The combination of digital technology and packet data switching has
> produced a high degree of inherent security to safeguard the privacy
> of users' data. The additional use of sophisticated protocols and
> unique radio modem designs make it extremely difficult to tap into
> the MOBITEX networks.

> Receiving and transmitting data over the airlink in the MOBITEX
> network is a very complicated process. It is a difficult task for
> radio modem manufacturers, not to mention much less sophisticated
> hackers trying to break into the network. It may be more cost
> effective to break into the user's computer system, rather than the
> MOBITEX network since the technical expertise needed to break into
> the air interface is so extensive.

> There are many inherent security measures built into MOBITEX and a
> wide selection of network features capable of enhancing data
> security. Unless one is transmitting very sensitive data, one need
> not be apprehensive about data security on the MOBITEX networks.

Bellsouth - from http://www.data-mobile.com/unshocked/security.html

> Mobitex protocol provides a high level of security. Data
> transmissions over a wireless packet switched network are much more
> difficult to capture than voice transmissions over a cellular voice
> network. Unlike conversations in the cellular environment, which are
> continuous and easily monitored by unsophisticated eavesdroppers,
> messages in a packet switched environment are sent in bursts.
> "Reading" such messages is only possible if the RF interface can be
> descrambled, a process requiring a level of personnel skill and
> software sophistication that is prohibitive. In addition, Mobitex is
> compatible with customer selected security packages, thus enabling
> the user to choose additional security for select messages.

Conclusions: BULLSHIT. Especially when Mobitex is a public, freely available standard. The most challenging part of this project was actually getting the Mobitex documentaion, everything else was a programming excercise. Not that proprietary protocols would have been more difficult to figure out - just ask Motorola!

Obviously the users of Mobitex networks have been lied to and raped by large corporate entities. The only real way to achieve data security over a Mobitex network is using real honest-to-god encryption. This decision is left up to each customer. The reader is invited to make an inspired guess as to how many customers actually choose to use real encryption after being told that it is virtually impossible for anyone to receive data transmitted over the radio link. The authors of this posting sincerely hopes that all those developers of portable terminals using RAM's network for credit card verification didn't listen too closely to what RAM was telling them.

The authors urge everyone to contact these companies and point out to them the error of their ways. When doing so be sure to emphasize you're reading data off a RAM's network with an el-cheapo scanner, a few dollars worth of parts from Radio Shack, and some really shitty code floating around the internet. It can't hurt to lie and tell them you're a HACKER (god forbid!) going by a handle such as 'Brunhilde' and that you're using your skills to collect dozens of credit card numbers off of RAM's network each day. Maybe then they'll decide (along with Morotola) to do something to secure their mobile data terminal systems such as bribing enough Congress-creatures to pass a law mandating 20 year prison sentences for anyone who has ever bought an op-amp from Radio-Shack (and now you know why Radio-Shack maintains a computer database of all of its customers).

****
6. The computer to scanner interface
****

The interface described here will allow you to monitor not only Mobitex systems, but with different freely available software packages you can also monitor POCSAG paging signals (PD203 package), Motorola MDC4800 mobile data terminal transmissions (just ask on this newsgroup)

decode Motorola trunked radio control channel information (see next blurb about a program called trunker.exe), and also shortwave RTTY and fax transmissions (HAMCOM and JVFAX software packages). Not too bad for a few dollars worth of parts!

------ IRRELEVANT NON-MOBITEX INFORMATION WARNING!!! ------

Some semi-new Motorola trunked radio control channel information for those poor souls palying around with trunker.exe: Those who might want to monitor 800MHz systems operating with some channels offset every 12.5KHz might want to look at my current best guess at the algorithm for converting a frequency assignment code into an actual frequency:

1. If the code is < 0x2D0 then
Frequency = 851.0125 + (0.25 * code)

2. For the remaining codes: if the code < 0x2f8 then
Frequency = 848.0000 + (0.25 * code)

3. If 0x32f < code < 0x340:
Frequency = 846.6250 + (0.025 * code)

4. If the code is > 0x3C0:
Frequency = 843.4000 + (0.025 * code)

I'm pretty sure 0x2f8, 0x340, and 0x3C0 are not frequency assigments - they define (within a spot or two) boundaries between blocks of information and frequency assignments. I've only been able to test this algorithm out on one system that used frequencies falling under cases 2,3, and 4 (anyone from the rural North Alabama or middle Tennessee areas will sympthasize with my plight) so there are no guarrantees that it works properly for every single frequency in your area. Any corrections to this information are welcome and thanks to whoever posted the right formula for 900MHz systems. And if you do post a message saying it's all screwed up include exactly which frequencies in your area aren't getting decoded correctly and maybe what this algorithm thought they were.

For those who want to send information to your scanner and have trouble configuring the serial port you will definitely want to remove the following line from the set8250 routine:

outportb (0x03fb, 0x00); /* set IER on 0x03f9 */

What this line did was to effectively undo the serial port parameter setup from just a few lines earlier.

Finally, those of you messing around with ways to tell your computer when to switch back to the control channel might want to just detect the disconnect sequence (11001010 sent at 300 baud). This works even using just your present interface (no audio is being transmitted at that time) without an additional low-pass filter section feeding into your computer just for sub-audible information. It's incredibly cheesy but you'll find it actually works.

---------- Back to Mobitex stuff ----------

Now for the really fun part - your scanner will need to be modified to allow you to tap off directly from the discriminator output. If you wait until the signal has gone through the radio's internal audio filtering the waveform will likely be way too heavily distorted to be decoded. This is exactly the same problem that our friends who like to decode pager transmissions run into - some of them have claimed they can only decode 512 baud pager messages using the earphone output of their scanner. These transmissions are 8000 baud so you absolutely must use the discriminator output. If you don't know where to begin modifying your scanner you might want to ask those who monitor pagers how to get the discriminator output for your particular radio.

Those of you who have already built an interface for decoding pager messages should be able to use that interface with some possibly minor modifications. For those people starting from scratch - you might want to check out packages intended for pager decoding such as PD203 and the interfaces they describe. The following excerpt gives an example of a decoder that is a good place to start experimenting (lifted out of the PD203 POCSAG pager decoder shareware documentation):

```
>
> 0.1 uF |\ +12v
> ---||----------------------|- \|
> AF IN | |741 \
> ---- | | /---------------------- Data Out
> | \ ------|+ /| | CTS (pin 5/8)
> | / 100K | |/-12v | or DSR (pin 6/6)
> | \ | |
> GND / ----/\/\/\---- GND ------ GND (pin 7/5)
> | | 100K
> | \ N.B. Pin Numbers for com port are
> GND / given as x/y, where x is for a 25
> \ 10K way, y for a 9 way.
> /
> |
> GND
>
> The above circuit is a Schmitt Trigger, having thresholds of about +/- 1v.
> If such a large threshold is not required, eg for a discriminator output,
> then the level of positive feedback may be reduced by either reducing the
> value of the 10K resistor or by increasing the value of the 100K feedback
> resistor.
>
> The +/- 12v for the op-amp can be derived from unused signals on the COM
> port (gives more like +/- 10v but works fine !):-
>
>
> TxD (2/3) --------------|<----------------------------------- -12v
> | |
> RTS (4/7) --------------|<-------- GND - -
```

```
> | | _ + 10uF
> --------->|------- - - |
> Diodes 1N4148 | - + 10uF GND
> | |
> DTR (20/4) ------------->|------------------------------------ +12v
>
```

DO NOT use the RI (ring indicator) as an input to the computer.

The authors strongly suggest tying the non-inverting (+) input of the op-amp to ground since you are working directly with the discriminator output and don't need a Schmitt trigger.

As an example, the authors are currently using the using the above circuit with the following characteristics:

1. The non-inverting input was tied straight to ground
2. The capacitance value was reduced to 0.02 microfarads.
3. The 100K resistor at the capacitor was raised to 2 MegaOhms
4. The op-amp used was an LF411

These changes were done primarily to reduce the loading on the discriminator output circuitry of the scanners used (one presumes the intial audio stages have high impedances). The capacitance had been reduced to 0.02uF to avoid the following problems while monitoring Motorola Mobile data terminals - when a transmitter kicked on it took such a long time for the DC level discriminator output to re-establish itself that the very first message was often cut off. In fact, when monitoring Motorola MDC4800 mobile data terminals the authors feel it prudent to revert back to a 100Kohm resistor. The moral of this story is play around and use your oscillscope to verify the interface is working exactly right!

Interface checking - use of the PD203 POCSAG pager decoding program is a good test. Additionally, the included program will tell you whether it thinks the interface is working during the startup process. This test only means that the input lines on the serial port are successfully changing states. It doesn't guarantee that your interface or scanner is suitable for 8000 baud operation.

Keep in mind that depending on your scanner and interface you may need to set the /BI:1 option in the program to invert the polarity of the incoming data.

A few words about your scanner - the receive bandwidth must be wide enough to pass the 12.5KHz wide Mobitex channel without problems. I doubt this will a problem for any scanner since they are built to receive 25KHz channels. However, if you have a narrow FM mode setting for 12.5 KHz channels then the filtering might produce too much distortion. So you might want to start experimenting with the regular setting that you use to monitor 25 KHz channels.

****
7. A Few words about the program
****

Remember - don't run this under Windows. DO NOT use control-c
unless you enjoy rebooting your computer on a regular basis (but you're
probably used to doing that with Microsoft products). To exit this
program hit any key on the keyboard. This program does not accept any
sort of keyboard input - all configurations are done with the command
line arguements listed below. An example of this would be (assuming you
called your program executable is called "mobitex.exe"):

mobitex /v:1 /cfs:0 /rn:0 /com:2

By default the program stores all received data in a file starting with
MOBYDA. Each time the program is run it picks a new filename so that
your previously captured data will not be overwritten. The program
defaults are set for operation with RAM's mobitex network (the only
parameter you might need to set is the bit inversion option which will
depend on your particular scanner and interface). The authors suggest
using a one line batch file with all the configuration information in it
for each type of system you will want to monitor.

By default, the program assumes you will be listening to a base
station, not a portable computer.

Finally, are you worried that your computer is too slow to keep up
with this mess? The very last number that the program prints to the
screen gives approximately the maximum value of how full the receive
buffer got. On the authors' systems running fast Pentiums this value
rarely exceeds 100 out of the full 15000 word buffer length.

- -
Summary and explanation of program command line arguement options

VERBOSE MODE: when enabled the program will show all received frame sync
and control bytes as they are received. You will want to set this
mode if you are examing an unknown system and want to verify that
this is indeed a Mobitex system.
/V:1 - print received system frame sync and control bytes
/V:0 - don't show the above (DEFAULT)

CHECK FRAME SYNC: If the frame sync option is correctly set for the
system you are monitoring then enable this option to better allow the
program to decode incoming data. If you don't know the frame sync
disable this option and enable the /V option to find out what it is.
/CFS:1 - check system specific frame sync field (DEFAULT).
/CFS:0 - Don't check it - useful for unknown systems.

FRAME SYNC: Each system is allowed to have its own frame sync sequence.
This option allows you to set it to whatever your particular system is
using. Once the proper Frame sync is specified you can enable the CFS
option.
/FS:XXXX - set system specific frame sync to HEX XXXX (DEFAULT B433)

BIT SYNC: The Mobitex standard specifies that this should be CCCC for
transmissions from a base station. The only reason that this is a user
option is because if you want to listen to the mobile transmissions
you must change this setting to 3333. These are the only two settings
that you should ever need.
/SY:YYYY - set bit sync to HEX YYYY (Default for base stations CCCC)

BAUD RATE: You can tell the program to run at virtually any baud rate
you want. If you don't know the baud rate of an unknown system you
probably should look at your received waveform on an oscilloscope.
/BR:Z - Z is the Mobitex system's baud rate (Default = 8000).

BIT SCRAMBLING: This option allows you to turn the bit scrambling off if
needed although the authors guess that most systems will be using it.
/BS:1 - System uses bit scrambling (DEFAULT)
/BS:0 - system does not use bit scrambling

RECEIVE CLOCK ADJUSTEMENTS: The crystal controlling your computer's
serial port might be slightly different from the author's. The current
routine will attempt to make up for this variation (within +/- 5 ns)
of the 840ns clock.
/CA:1 - program attempts to fine tune receive clock (DEFAULT)
/CA:0 - program does not attemp to fine tune receive clock.

BIT INVERSION: Your scanner and interface combination may invert the
incoming data. If so this option must be set.
/BI:1 - Inverts incoming raw data.
/BI:0 - don't invert incoming raw data (DEFAULT).

RAM NETWORK mode: If set, the program decides that a sync and control byte
sequence is followed by data blocks if the second control byte has
bits 1 and 2 zero. If not set then the program checks to see if a data
block follows EVERY sync/control byte sequence. This probably should
be set to zero for non-RAM systems.
/RN:1 - RAM only: control bytes determine if data blocks follow sync.
/RN:0 - always try to decode data blocks regardless of control bytes.

OUTPUT FILE: If you don't want data written to an output file (with a
unique filename) disable this option. This might be useful for
troubleshooting if you suspect disk access is causing problems.
/OF:1 - Write data to output file (DEFAULT).
/OF:0 - Don't write output data file.

COM PORT: Allows you to set which com port you want to use with your
interface.
/COM:z - set z = 1,2,3,4 to set com port you want to use.

- -
Suggested procedure for an unknown Mobitex system:

1. Find out the correct baud rate. Best bet - use an oscilloscope.

2. Start out with following options set: /RN:0 /CFS:0 /v:1

3. If you don't known whether you need to invert the incoming data the authors suggest the following procedure: try both /BI:0 and /BI:1 options. The correct setting will probably be the one which gets good control bytes (you don't see the "BAD Control Byte FEC" message as often).

4. You want to look at those lines with good control bytes and indentify the system specific Frame sync. From now on, when you want to monitor this system use the /FS: and /CFS:1 options to tell the program to actively check for this frame sync. If things are working reasonably well at this point you should only good control bytes appearing on the screen every time you hear some data coming over the channel.

5. At this point the only option you have left to play with is the /BS: option. You will known if the /BS: option is correctly set when you see valid data blocks appearing on the screen - they will look something like :

6F6C6F6775653A2049424D204D6F62696C65A73B ologue: IBM Mobile&#65533;;

If you see any blocks of this form then all parameters are correctly set - such blocks had to go through several hurdles involving forward error correction and a CRC check and would have not been displayed if program parameters have been incorrectly set.

6. Sit back and snarf the data. In order not to see the same frame sync and control bytes from appearing over and over you now probably will want to set the /V:0 option. Keep in mind that very little actual data may be flowing over the network you are monitoring. Because of this the authors have been known to leave their computers and scanners monitoring a specific Mobitex system all day while they are off at work.

- -

As far as compiling this - save the latter portion of this posting (the program listing) and feed it to a C compiler. Pretty much any C compiler from Borland should work. If you (Heaven Forbid) use a Microsoft C compiler you might need to rename some calls such as outport. Follow any special instructions for programs using their own interrupt service routines (my compiler package recommends turning the "Use register variables", and "stack warning" compile options off). It also does not want anything whatsoever to do with Windows. Please don't even think about running this program under Windows.

****
8. Finally - the program listing itself

I was listening to a local scanner net on my scanner & one of the Hams
said it best. What he generally said was that this whole old folks thing
in Florida was an inside job. This couple contributes to the Democratic
party & etc. This would explain why the geazers (forgive my spelling)
have been charged with anything.
If any of us here on this board were to record a congress persons
conversation ,we would be in jail right now.

Ryan

In order to eliminate that noise you must use a scanner that has ctcss (tone board). such as the bearcat 590 or 760 with optional tone board.

Once you enter the frequency, you then enter the tone (OPP is 107.2).

Now only the voice part will break through and that noise will not be heard.

Hello :
Bearcat BC-3000XLT Hand held scanner delivered UPS to your door
for $249.00. I have two and need to sell one. It is in excellent shape
with no scratches or dents. Never taken out of the house. Non smoker.
Have the box, manual,scanner, battery and charger, duck antenna and will
include the Uniden black leather protective case worth $19.00 with this
purchase (Not included when you buy the scanner).
One of the best handheld scanners out there.
I can be reached at 513-732-1224 here in Cincinnati or E mail.

Thank You;
Gary Wilburn
W8VI
Features of the Uniden Bearcat 3000XLT;
400 Channels, 20 banks with 20 channels per bank. Just right for many !
25 to 1.3 GHz (no cellular except harmonic or IF on 1005-1025 Mhz)
Twin Turbo Scan and Search - 100 & 300 CPS. Faster than the rest.
10 priority channels.
Green back lit display. Keep it on or 15 second time out available.
AM, WFM, NFM Modes. Scans at 5,12.5,25 and 50 khz.
Selectable attenuator on each channel plus lock out. Nice feature !
Auto sorting of frequencies in each bank.
Auto store with frequency transfer. Search and store then move features.
Data or noise skip feature. Works well for me.
Weather Search Key. Scans 162 mhz weather band for strongest signal.
Does an excellent job of rejecting intermod, even with outside antenna.

> IZM
There is no battery in the BC101. I have one too. It uses the very first magnetic core memory chip for all its programming. When it dies, you throw it away. Mine is almost gone! The frequencies sometimes load, and sometimes not. Some channels are totally dead. Don't think you can get another replacement chip. Good luck!

Can anyone point me in the right direction for the detailed mods
for the Uniden BC890XLT or Radio Shack Pro 2036 (same scanner).
I have one mod which removes 3 chip resistors close to microprocessor
and installing the chip resistor at the 2 pads closest to the battery.

Well I am looking at that particular place and I'm not to sure where
the empty pad is. Has anyone done this mod and can help me before I
screw this up!

Thanks for your help
Jim

Only in very limited instances. Very limited.

>Is it a good radio, aside from the beartracking function?
So-so. Nothing to write home about, but it will pick up your local
PD.

>Also, what is the general range (in miles) a scanner can reach?

Scanners have no range. Their reception is only as good as the
transmitter they are listening to. They are not a transmitter.

Thank you for preparing that very interesting review about R-10.
I have read it with much interest, (but first I went to see the
picture of your two cats).
In spite of slow scanning speed and other firmware restrictions I am
still interested in this model. It seems very comfortable to be
carried in my pocket allowing listenings here and there, at home, in
my car, during trips, during voyages.
I should like to use it for listening radio amateur bands (sometimes),
and major broadcastings like BBC, VOA and similar on Short Wave bands
to improve my english understanding (every day).
Using medium wave one can listen them only by night, while having
short waves one can find the right band to listen them during the day.
But i read in your review that in SW "the AM filter is just too wide
to prevent even minimal adiacent interference" and suggested
to use a good antenna.
May you tell me something more about this?
What may R10 listen on broadcasting bands using the little stock
antenna?
May it receive at least some major stations like BBC and VOA?
Thankyou for any suggestion, and good listenings!

Source record: 204160

Thankyou Mike Schuster for answering me.
I saw in other messages of this group that you know both R-10 and
WS-1000.
Please, say me something about your experience in short wave
broadcasting bands.
Did you listen with them to big broadcasting like BBC and VOA?
Could you find the SW right band to listen them during the day?
I should like to do this to improve my english comprehension,
but common medium waves radios get distant stations only by night.
Both that radios seems nice to be carried in one's jacket also
when outdoors, like a small telephone, permitting a good exercise.
In few months one could became a great languages... listener :-)
Thankyou and big listenings ever!

Uhh...it's passive, but isn't frequency dependent AND helps Tx & Rx,
while duplexing? Short of marginally increasing the surface area of the
antenna (and probably detuning the original as well) it sounds like a
high-priced placebo.
It looks a bit
> goofey but if it works I wouldn't mind putting it on just for those

>
> Just a gimmick?

Just a guess here, but I'd wager it's chiefly designed to separate
substantial amounts of cash from the unwary.

Really work? Anyone have any experience?

My closest experience was being at a CB/Hamfest/Flea market. One guy
was selling "broadband power amps" in mini-boxes about 3"x3"x1.5". They
had 2 SO-239 connectors, a red binding post marked "Power", a grounded
brass stud marked "GND", and one red LED. The case was held together
with allegedly-tamper-proof screws. The whole thing weighed about 6
ounces. It was hawked as improving both transmit and receive signals
from 2-148 MHz without tuning, but "works best around 11 meters". I
asked to take a look at one, and the vendor, who was doing a land-office
business in them, agreed. I whipped out my handy-dandy special
screwdriver, popped out the 2 screws holding it shut, and found:
Solid copper wire going from one RF jack center lead to the other;
Wire from "Power" input jack, thru resistor, to LED;
Wire from "GND" stud to other side of LED;
Nothing else, except expensive ($79) air.

When I left, people were clamoring for their money back...well, most of
'em; some apparently thought they still got a good deal. Go figure.

Err, sounds kinda bogus to me, Bro.

Here's something to run through the mill:

1. Whether radar is accurate or not is irrelevant. You still have to piss away a day of your time in court defending yourself, so even if you win, you lose.

2. Speeding itself does not make you dangerous. But, cocky bastards who speed excessively usually drive like jagoffs anyway. Furthermore, the faster you go, the longer it takes you to stop and the less time you have to react to panic situations.

3. To the previous poster who bragged about his hot car: If you really want to scream, get a motorcycle. There is no street legal car that can come close to touching even an average bike in overall performance (I refer you to a recent article in "Motorcyclist" magazine where a stock $11,000 Kawasaki ZX11 kicked a $65,000 Viper's ass...by the way, the Viper threw a rod during the shootout). In case you haven't figured it out, I am biased toward motorcycles because I own one.

No biggie. Just my opinion.

We now return you to our regularly scheduled programming....

> expanded to cover additional areas. I am watching for additional
> frequencies as they become available.

I don't recommend a printer, you will go through lots of paper.
Most of the reports are wind warnings from Southern California
and Nevada. For some reason, the broadcasts have an extra line
feed (prints every other line - on every package I tried). Save
the text to disk.

BTW: I use the Ramsey "P-IBM" TNC kit, a "Baycomm" type adapter,
(flea-market special) with WinTNC (Windows3/95) or the G7JJF DOS
package. Works fine.

The DOS terminal software does not require much in the way of
horsepower, so you do not need a powerful machine. It's the
perfect application for that old 286 laptop with 1MB memory.
Specify "COM1 or 2" as your logfile and spit the data out to your
"real" computer via the (other) serial port.

For more info, take a peek at:

http://tapr.org/

or just do a AltaVista search for "Packet Radio TNC".

Thanks. Now go back up the page, re-read the part about TIME DIVISION
MULTIPLEXING and it might become clear to you that we are NOT TALKING

about the AMPS system of analog fm cellular phones used in the USA but a more sophisticated, more secure, digital system on 960MHz used in many other countries. I am using the right equipment, I do know what I am talking about.

We also have the analog system that you are listening to on your scanner, but it is old hat and the system is being phased out by the year 2000.

Please also note that unlike you, I have not resorted to any form of rudeness in my reply. Please write your apology in the space provided below.

Brad Granger.

Thanks for the kudos, Giovanni! I am glad you pointed out the feature I
missed about adding search-skip frequencies to memory while searching.
It does do as you say and I will have to update my review accordingly!

> I just would add to your "to do list" 2 items that, in my opinion, are

Agreed. Like most of their firmware, it appears as though those who
wrote it never really used this type of radio out in the field which
puts undue constraints on us users.

> b) To enable the user choice if to clear or not the bank Q before
> starting the Auto Memory Write Scan. An alternate possibility is to let
> the user choose which bank has to be the target bank (no matter if 50 or

> two possibilities forces the user to start it and to hope he/she will
> never stop it, unless he/she has enough freetime to save in another bank
> all the previously discovered frequencies.

Again I think this is one of those Japanese design princicples to
protect
the user from hurting him/herself. AOR, Icom and Yupiteru all do the
same thing and is quite annoying. Reading my advanced copy of the
MVT-9000
User's Manual, I see auto-write is hardcoded to one bank which gets
cleared every time you start this feature.

Maybe we have an undercover Uniden operative who works for AOR, Icom and Yupiteru who is on the design teams and puts in all these "stupid" restrictions to ham-string the competition!

> In my opinion, most of the desired firmware improvements could be made
> possible by simply empowering the SET menu, that actually is extremely
> poor. A problem is what we should do with our radios when (and if)
> Mr.Icom-san will decide to release a new CPU version.

Personally, I won't be holding my breath! ;-)

>A wise man once told me that if you are REALLY speeding, say 120MPH on
>the highway
>and you pass a cop, just put your foot down and keep on goin'! <G>

You'd better be damn sure I don't find you. I'm not a cop, but that kind of irresponsible running from the law is what gets a lot of innocent people killed. You kill anyone I know with a stunt like running from a cop and I'm going to find you if it's the last thing I do. It's not very funny when somebody's kid gets hit by one of you fools doing 120mph.

You also better be damn sure your car can go over 180mph. ooops, that's 186,000 miles per SECOND. That's how fast the radio waves travel that the cop you just buzzed by is sending to every cop in the state.

I have a friend who is a cop who tested the Chevy Caprices when the first came out. He had it up to 140 on a deserted road in the middle of the night before he ran out of room. If you're in CA and they have the mustangs or similar, you're in worse shape.

THINK BEFORE YOU SAY STUFF LIKE: A wise man once told me.....

Geezzzzzzz

The Interstates were built with a
>design speed of 100 mph.

Maybe so, but your brakes and your brain weren't intended to process distance and stopping time information at 75 when you have less than 2 car lengths between you and the cars around you.
It was assumed that as technology advanced
>cars would get faster.

It wasn't assumed however, people would try to read the fine print on your license plate while you're doing 75.

>Speed doesn't cause accidents and never has.

You are right! Just look at NASCAR. Those guys can drive at whatever speed they want. It's when they rub bumpers and try to pass at that speed that gets them into trouble.

>Moronic incompetent drivers in rattle trap shit cars cause accidents.
>I'd bet I'm a safer driver at 95 mph than you are at 45.

I wouldn't put money on that bet. How much time do you have to react to something on the roadway at 95 anyway?

And if I want
>you to preach to me, I'll come to your fucking church.
>
>Scott Gibson

If you keep driving at 95 you may end up in church wether you want to or not. If you want to drive at 95, that's your choice. But, when you place yourself at a greater risk by doing this speed, you also place me at a risk when you blow a tire and roll 37 times. If I wanted your need to justify 95 on a crowded interstate, I'd listen to you explain why my uncle is dead.
Thus, I give you the universal hand signal of the road.

Tyler

5158. Philadelphia FBI Frequencies

Got this Lifestyle Fascination catalog in the mail yesterday. Lots of neat but quite overpriced stuff inside. One item caught my interest.

Powertip Signal Enchancer - $19.95
Looks like a small lightbulb maybe the size of a small egg or golf ball. "... Simply slide it over the tip of your present antenna - that's it - your phone will now operate at increased ranges, your radios will pull in distant signals! ..." Claims to work with cordless or cell phones, radios and any wireless device with an antenna. It looks a bit goofey but if it works I wouldn't mind putting it on just for those cases when I need to take my 900 Mhz digital cordless phone far from the house.

Just a gimmick? Really work? Anyone have any experience?

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies. It's clear from the discussions posted on the Internet that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a

diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz

band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio | Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel | Uniden/Bearcat BC860XLT base is a good value and available | at most Wal-Mart stores. The new RELM HS200 portable | performs very well is an excellent value at its $250 street | price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio

Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private

Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I | use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the | VHF-low band, but will allow reception there at least |

as good as shorter antennas.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove.net

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life *
of their own. Frequently, they are plagiarized from the
Internet and compiled by book, CDROM, and magazine
publishers, sometimes reworded, then sold. Hobbyists then
copy the modifications from the books, CDROMs, and
magazines back onto the Internet or BBSs (bulletin board
systems)!

Grove Enterprises and other companies advertise a
warranted, modification for fee service.

For information on "virtual downconverter" modifications,
see Steve Donnell's article in January 1995 RCMA Scanner
Journal or February 1996 Monitoring Times. Reprints of
articles from Monitoring Times are available for $2.00 each
plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of the $2.00.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner
back to the manufacturer for repair, here is one company
which repairs scanners:

- G & G Communications (telephone 716-768-8151) -
(www.iinc.com/ggcomm or email ggcomm@iinc.com or
ggcomm@aol.com) This family owned company repairs
scanners and pagers and stocks parts for several older
models. G & G cannot usually repair AOR scanners due
to lack of manufacturer support. G & G sells and
sometimes buys old scanners and parts, too. They are
located at 9247 Glenwood Drive, LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are |
discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and
assigns them specific frequencies. Groups of frequencies
are allocated to specific types of users, so you won't
usually find fire departments using the same frequencies as
taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from
several sources, including books, government microfiche
records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain selected business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its

coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

The Scanner Club is the name of a bimonthly magazine published by Les Mattson. It is a successor to the Northeast Scanning News and is the official publication of The Scanner Club, a not-for-profit club organization. TSC's main strength is local frequency information, including CTCSS codes. Sample issues are $4 each. A yearly membership costs $24.95 and includes 6 issues. Write to The Scanner Club, PO Box 62, Gibbstown, NJ 08027 for more information.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either

automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states,

and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm |

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $13. Police Call Plus is

basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is expected soon and will be available from Grove Enterprises for about $30. This second edition is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's

book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US.

However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. Rich Barron maintains an interesting site at www.exo.com/~rbarron.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the

FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or

anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the

channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a

receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to
him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the
"instructors". Mystery solved; I had been monitoring the
customer training center for a large computer manufacturer.
The training center has hotel rooms and dining facilities
to accommodate students from out of state. As a
convenience, shuttle van service is provided to local
shopping malls.

Summary

Through books, government records, and radio clubs, scanner
listeners can make use of frequency information compiled by
others. Two-way radio users often fail to identify their
transmissions properly, making it more difficult for
listeners to know who they are monitoring. By examining
radio equipment labeling, and monitoring and taping
transmissions, scanner enthusiasts can unearth new
information.

Gee, EEB told me all they carry is the CAT interface ($84). I have read lots of recent messages on the 8000 interface, but I know *I* remain confused (my 8000 is on its way, so I am getting ansy too <g>).

The OptoLinx has more functions than I need, isn't exactly "cheap", and apparently has taken away some features like tape control in recent production. It is attractive since it apparently uses more than TX in/out. My question is what use does it make of the squelch line and audio line (if any)? Do you have to use a particular software to exploit it? I have the same frustrations as others with scanning software based on my 2700, IC-706, and 2006/456LITE usage (I think I have yet only Probe to try, but I've not found a demo).

The CU8232 is available from Javiation for $150 (last quote I got). I do not know if it offers anything over the OptoLinx--anyone know?

I am thinking I might as well do the same mod to the 8000 as I did with the 2700. I put in a stereo 1/8" jack connected to gnd, TX in, and TX out ("Scout mod") and hooked this up to the 232 with a cheap and effective MAX232-based circuit (ala Paul Richards' design--paul@hitech.demon.co.uk--I forget Web page it's on).

Thoughts/opinions?

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 5A95, means the scanner was made in the 5th month of
1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Schematics, Owner's Manuals, and Parts Available

Service manuals for most Radio Shack scanners may be
ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a
Photophacts from Howard Sams Publishing division of

Prentice-Hall at (800)428-7267.

Parts lists for recent models are available on line at: |
http://support.tandy.com/support_electronics/2849.html.
Parts may be ordered through your local Radio Shack store
or through Tandy National Parts, telephone (800)442-2425.

G & G Communications (telephone (716)768-8151) is a family
owned company which repairs scanners and stocks parts for
several older models, especially Electra/Bearcat and
Regency brands, but they don't sell manuals or schematics.
They are located at 9247 Glenwood Drive, LeRoy, NY 14482.
(http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or
ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022,
PRO-2004, and PRO-2005/6 is implemented by an
electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is
designated EL-501, and is identified by Radio Shack part
#10800050. A new EL panel can be ordered through your
local Radio Shack store and sent to your home for about $12
plus shipping. Radio Shack no longer sells replacement EL
panels for the PRO-2004.

Replacing the backlight is an operation which requires care
and patience. The service manual has an exploded parts
diagram which is helpful in showing how to disassemble the
scanner.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables,
e.g., PRO-39 and PRO-43, can become unreliable after
prolonged use. The best repair is to replace the rubber
keypad instead of trying to restore contacts using
chemicals. A replacement rubber keypad may be ordered
through your local Radio Shack Store for about $4.00.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part
#EAS-3P123A). The voice coils in some of these speakers
have opened, resulting in lack of audio output, though
audio is still available from the earphone jack. A more
capable 500 mW speaker is available through Tandy as
replacement (EAS-3P127).

library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
60 old and new scanner radios and monitor receivers. Other
topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase

most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units

unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which

were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews and modifications of these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Oct 1996 - Radio Shack PRO-2046 mobile
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10

Note: Reprints of Monitoring Times articles are available for $2.00 each (plus self addressed stamped envelope) from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this $2.00.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity,

attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996.

ICOM

R-10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a | search and stored in a final bank of 100 channels which is | cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful

search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997.

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency

of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of

preprogrammed channels Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat

BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT

Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz

band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004

Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission. See September 1996 Monitoring Times for modifications.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider

frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar #chan- VHF VHF UHF lock-

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner

crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by

the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

- 2 -

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built

in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service for the Plectron P1 and R700 models is

offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal
Signal in University Park, IL, phone (800)524-3021. You
can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone
(800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

HAMFEST/COMPUTERFEST CALENDAR 1997 - NORTHERN ILLINOIS
last updated February 8, 1997

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale and ARRL for providing some of the information.

MARCH 1997

Mar 2 (Sun), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Mar 9 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Mar 9 (Sun) - Waukesha, WI. SEWFARS Swapfest. Waukesha County EXPO Center, Waukesha, WI 8:00 AM Talk-in on 146.820 pl 127.3 $4.00/$5.00 Ham Radio. Computers. Electronics. Amateur License Exams. For information Contact SEWFARS, PO Box 102, Delafield, WI 53018. 414-650-0724

March 23 (Sun): Grayslake, IL - LAMARS hamfest, Lake County fairgrounds. All indoors. Admission $5 at gate, free parking. Setup at 6 AM, doors open at 8 AM. VEC testing 9 - 12. For Information contact LAMARSFEST, 650 Green Bay RD, Lake Bluff, IL 60044. (Small fest, but usually interesting - AJ9S.)

APRIL 1997

Apr 13 (Sun), Chicago, IL - CARC Ham Auction. DeVry Tech, 3300 N. Campbell Ave. Will auction your electronic goods at this auction if you bring them in before 12 noon. All goods subject to 10% donation. If purchased back by the sell, then 5% will be due. All sales as-is and final. Info: Dean (708)331-7764 or George (312)545-3622, days.

Apr 19 (Sat), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Apr 20 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Apr 27 (Sun), Arthur, IL - Moultrie ARK. Contact Ralph Zancha, WC9V, tel (217)873-5287.

MAY 1997

May 3 (Sat), Cedarburg, WI - Ozaukee Radio Club Swapfest, 8:00 AM. Circle B Recreation Center, Intersection of HY 60 and Ozaukee Cty I. Talk-in on 146.37/97 and 146.52 $4.00 Amateur License exams. Amateur Radio. Computers. For Information Contact O.R.C. Swapfest Committee, W58 N985 Essex Dr, Cedarburg, WI 53012-1439 or call Gabe at 414-377-2784 between 6:00 and 8:00 PM.

May 4 (Sun), Sandwich, IL - DeKalb KARK Hamfest. Sandwich Fairgrounds at Suydam and Gletty Roads. Admission $6. Overnight camping on grounds $10. Talk in 146.73 or 146.52 MHz. Info: Bob Yurs, N9ZNA (815)895-3219 or n9zna@aol.com. Web page: www.tbcnet.com/~jleonard/hamfest.htm (Good, medium sized fest which grows each year. Good restroom facilities. Few commercial exhibitors. - AJ9S).

May 10 (Sat), Peotone, IL - Kankakee Area Radio Society hamfest. Will County Fairgrounds. I-57 to Peotone exit 327 (east). 6 AM. Admission $4. Talk in 146.94 MHz. Info: Willis Bowser, K9IFO (815)472-2079.

May 18 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

May 25 (Sun), Chicago, IL - Chicago ARC. DeVry Tech, 3300 N. Campbell Ave. Admission $5. Info: (312)545-3622 or (312)486-6823.

May 31 (Sat), Springfield, IL - The Sangamon Valley Radio Club. Illinois State Fairgrounds. This Hamfest is "rain or shine" with over 100,000 square feet of covered and lighted fleamarket space, plus indoor facilities. Info: Don, W9EBK at 217-789-4519.

JUNE 1997

Jun 1 (Sun), Princeton, IL. Bureau County Fairgrounds. Free parking. Info: Debbie Burton, N9DRU, 1153 Union St., Marseilles, IL 61341-1710, tel. 815-795-2201 (Usually an excellent hamfest, with sellers from Illinois, Iowa, and Wisconsin. - AJ9S.)

Jun 8 (Sun), Wheaton, IL. Six Meter Club of Chicago. DuPage County Fairgrounds, 2015 Manchester Rd. 7 AM. Admission $5. VEC tests 9 AM - 1 PM. Talk-in on 146.97 MHz (107.2 PL) or 146.52 MHz. Info (708)442-4961 or contact Joe Gutwein, WA9IRJ, (630)963-4922.

Jun 8 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Jun 22 (Sun), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

JULY 1997

Jul 13 (Sun), Sugar Grove, IL - Fox River Radio League, Waubonsee Community College, Rt 47 at Harter Rd. 6 AM. Admission $5. VEC tests 10 AM only. Talk in 147.21 (pl 103.5 & 107.2 Hz) Info: Diana, WD9API (630)293-7485.

Jul 26 (Sat), Pecatonica, IL - Rockford Amateur Radio Assoc. (RARA) Amateur Radio and Computer Hamfest. Winnebago County Fairgrounds, about 15 minutes west of Rockford, Il. Talk in on 146.61 MHz, 114.8 Hz PL. This will be in the main exhibition hall with room for tables. Ham Radio Vendors, Computer parts vendors, tailgating, food. Code receiving contest, Throw the Radio contest, Great door prizes. For table reservations contact Mike Anderson at (815)397-4304 or mander5@ix3.ix.netcom.com. For any other information contact Marsha Plasters at (815) 399-9233 or wa9ffl@aol.com.

AUGUST 1997

Aug 16 (Sat), Franklin, WI - 7:00 AM, C.A.R.S. Crystal Ridge Ski Lodge. Talk-in on 442.200+ pl 100.0 / 146.52 simplex $4.00/$5.00 Radios. Computers. Electronics. Concessions. Door Prizes. Free parking. Free camping. Large Tailgate selling area. Electricity available, $1.00. Contact C.A.R.S., PO Box 325, Franksville, WI, 53126-0325. 414-325-7427

Aug 16 (Sat), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Aug 24 (Sun), Woodstock, IL - Tri-County Radio Group. McHenry County Fairgrounds, Rt. 47. 6 AM. Admission $5. Talk in 146.52 MHz. Contact Bob Grosse, N9KXG. Info (voice/fax) (847)658-1678. http://www.angelfire.com/il/tcrg/ (Smaller, but fun fest. - AJ9S)

SEPTEMBER 1997

Sep 27 and 28 (Sat & Sun), Grayslake, IL - CFMC's Radio Expo 97. Lake County Fairgrounds, Rts 45 & 120. Admission $6. Talk in 146.76 MHz. Info (708)457-0966. (This is probably the biggest and best hamfest in N. Illinois - AJ9S).

NOVEMBER 1997

Nov 15 & 16 (Sat & Sun), Fort Wayne, IN - Fort Wayne Hamfest. Indiana ARRL State Convention. Allen County War Memorial Coliseum Expo Center. Sponsored by the Allen

County AR Technical Society. Admission $5. Parking $2.
www.pipeline.com/~dagagnon/. Info: (219)484-1314.

NOTES - Computer Central and Giant Computer shows

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm.

Giant Computer shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $5. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know

if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold.

That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197	47K try 220K.
Radio Shack PRO-2004	R148	47K remove R148 or replace with 220K.

	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is
Electra/Bearcat 20/20	R75 2.7M may be ok as is
Electra/Bearcat 250	R66 2.2M may be ok as is
Uniden/Bearcat 760XLT	R58 22K replace with 6.8K
	or other value.
	(select value for
	the particular radio.)
	Located on pin 14
	of MC3359P IC
Uniden/Bearcat 800XLT	R91 860K replace with 2.2M.
	Located on pin 14

Don't dispare! Why don't you simply contact Uniden? If everything else
fails, I'll try to help (I've got a manual, but maybe Uniden can
provide you with an original).

I'm talking about frequencies in the range of 400-1200MHz. The main
issue here is how much does the glass absorb if at all.

5176. Mobile Scanner Cell look-alike antenna opinions

Newsgroup: rec.radio.scanner
Date: 1997-03-14 00:00:00 UTC
From: fancher <fancher@bms.com>
Message-ID: <33297864.B08@bms.com>
Source record: 204203

I'm looking for opinions on how well mobile scanner cellular look-alike antennas perform. Are there known deficits in their performance? If so, what? Who makes the best one, and what makes one better than the other? Also, is there a preferred spot(s) to mount the antenna (on the car)? Do they all come with the same cable, or can this be changed to something which may be better? And lastly, how much $ can I expect to pay? Thanks in advance for your replies.

Marc

I have heard that there are some software programs out there that allow you to invert and revert wav files but not anything that will do it in real time other than the actual piece from the phone. Which itself is an option. If it is not a 'part' of a chip and it it's own unit you might be able to buy said phone remove the speech descrambler/scrambler and wire it into a nice radio shack box and plug your audio out into it? Or something along that line. Of course I am just brainstorming. I have often felt the challenge to build such a thing but I dont have the $$ to buy the phone and tear it apart.

Scott Gibson wrote:

(snip)
>Speed doesn't cause accidents and never has.
(snip)

True...speed does not CAUSE accidents, it only INCREASES the a SEVERITY of accidents. The severity of injuries and likelyhood of fatalities increases with speed, regardless of who caused the accident. You can cite the statistics about the numbers of accidents since limits went up/down all you want, but simple laws of physics apply here, and those laws can't be changed like a speed limit. You hit me at 100 mph and someone will most likey die in the accident. Hit me at 55 mph and my chances of survival are greater. (15 years of law enforcement experience talking here.)

A philisophy I have adopted about driving is this:

I try to drive so that no car around me must alter his speed or course because of any of my actions. This means I merge into traffic so no one must change lanes or change speed. When I leave traffic, the same applies. I try to make no left turns from a 2 lane roadway so no one must stop behind me. If someone is coming up behind me, I try to leave a space for them to get around. Ideally, all the drivers around me should be able to continue driving as if I was never there. I haven't had an accident since I started driving in 1969...if you don't count the deer that nailed me on the interstate a few years ago!

Also, if you have a 30 mile drive and you average 55 mph, verses the same distance at 75 mph you save about 8.5 minutes of driving time. Those figures are under ideal circumstances. They don't take into account the fact that traffic lights and normal vehiclular congestion often allow the slower drivers to cath up with the faster drivers at red lights throughout the trip. This makes the 8.5 minute lead shrink a lot.

Seems to me it would be easier to get up 8.5 minutes earlier and avoid having your blood pressure soar because of all of the "damn drivers going the speed limit" around you. You save gas, wear and tear on the car, and you reduce the chance of getting stopped for speeding (which usually takes more than 8.5 minutes.)

Just my opinion...nothing more.

5180. Review of Whistler 945 detector needed

>
>Maybe so, but your brakes and your brain weren't intended to process distance
>and stopping time information at 75 when you have less than 2 car lengths
>

I slow down in traffic. I don't have less than two cars lengths in
front of me at 75, I usually don't have less than four. I have a fast
car in top mechanical condition and I don't drink alchohol or do
drugs. I try and plan ahead when going through traffic and stay ahead
of conditions. I'm still not protected against some moron doing
something completely unpredictable, but so far quick reactions and a
responsive car have kept me out of trouble.

>
>I wouldn't put money on that bet. How much time do you have to react to
>something on the roadway at 95 anyway?
>

Not as much as you do at 45. My point was I probably will react. When
I am driving, I am driving. How many people do you know who consider
driving an inconvenient chore they have to perform while getting from
point A to point B? How many people do you see in rush hour traffic
reading a book or the newspaper? Or chatting animatedly with their
passengers while occasionally looking at the road? I was just betting
that the rev is probably one of those who don't consider driving their
first priority when in a car.

>

>blow a tire and roll 37 times.

Granted it could happen, that's why my car keeps almost new Z-rated
Yokohamas on it. All life is a risk. You have to decide how much risk
you are comfortable with. I've had a blowout at 75 mph that was
completely inconsequential. I merely let the car slow on it's own
until I could pull into the emergency lane and change the tire. I've
also been thrown from a motorcycle at 60 mph when an unseen pothole in
a sharp turn threw me off the road on to the shoulder.

> If I wanted your need to justify 95 on a
>crowded interstate, I'd listen to you explain why my uncle is dead.

Sorry about your uncle. Give me the details and I'll take a shot at
why your uncle is dead. Alchohol rather than speed is the more likely
culprit. If not in your uncle, then perhaps in those who collided with

him.

>Thus, I give you the universal hand signal of the road.
>

Cheerfully returned. In fact, I encourage you to go further south and spread that hand signal around to others. Just last week, we had two black men shoot a 90 year old woman because they didn't like how she was driving.

: address for tech questions mentioned there. Can someone help?

I don't have one (yet), but I have never heard of a "Frequency Transfer
option" on the 3000xlt. All the reviews and specs I've looked at have
NEVER mentioned this.

: Actually, what I'm looking for is a scanner with FAST search
: capabilities AND computer interface or at least possibility of reading
: it's current frequency. Ideas, anyone?

Well, the 3000xlt won't meet your needs as it does not have a computer
interface. However, it is FAST in both serach and scan.

I don't know how fast the AR8000 is, but it does have computer
interface. The Icom R10 also has a computer interface, but is SLOW in its
scan rate.

There are two ways, but both involve adding hardware to your PRO-2004. One is to acquire or build a Data Squelch type of circuit, available from Bill Cheek (bcheek@cts.com). The other is to add CTCSS (commonly known by the tradename PL) tone decode capability. OPP voice transmissions are accompanied by a 107.2 Hz subaudible tone, so if you can screen out all traffic without that tone, you won't hear the guard tones.

Mobile extenders are used by H.P. cars because the range they are from the base antenna or "HQ" is so far that the handheld radios won't reach.
When the officer is out of his car he switches on the mobile extender which re-broadcasts his car radio on a VHF frequency programmed in his handheld. This handheld communicates on the mobile extender frequency and rebroadcasted over the main frequency. For example, the cars in my area use 42.360 as the district channel, the mobile extenders are on 154.905. When these cars are close enough (3mi. or so) you can hear the district channel on the mobile extender freq. I don't know if they leave them on all the time.

Doesn't it also state somewhere that is is lawful to listen to any frequency long enough to identify it's source. This is off the top of my head so I will try to Validate my statement if I can find it. There are also numerous local laws that have even more strict regulations on scanning.

Mt. Palomar (San Diego Area)

37.38
Loma Prieta (S. Bay, Montery, Santa Cruz Area)
Mt. Wilson (Los Angeles Area)
Antelope Valley (Palmdale, Lancaster Area)

450.0375
Mt. Diablo (Bay Area, Sacramento, Stockton Area)

The first two frequencies are the state OES packet frequencies. I
have not tried this yet as I do not have a TNC. All that is required
is a standard amateur packet TNC, a good receiver or scanner that will
tune the 37 and 450 mHZ freqs, an outdoor antenna and a printer if you
want a printout of what you receive. The system is going to be
expanded to cover additional areas. I am watching for additional
frequencies as they become available.

Jerry

I just opened up a new scanner site and would appreciate feedback.
Your suggestions can only make it better. I admit it is a small site
but will grow as time and resources permit. So stop on in, look
around, sign the guestbook and tell me what you think!

http://home.earthlink.net/~wyoron/

Thanks for your help!

Love it....many of the adverse comments in this group are correct...but some of them are just nitpicking.
Although , if Icom do offer a reasonable software upgrade, I willconsider taking advantage.
In short, if you want a good all round receiver which does pretty much everything except break speed records, it's great.

I have been testing a new frequency database that will be coming out soon. It is called ScannerBase CD. It has alot more features and printing options than the Percon Database. If I could only buy one I would have to go with the ScannerBase CD for its versitility.

Gosh, rev, thanks for that insight. I recommend you suck my ass. I also recommend you park your car and never drive again. You're probably one of the ones I see on the Interstate going 55 in the right land feeling so smug and self righteous while traffic is flowing around you at 75+. I can hear you now, "I can't understand why all these people have wrecks around me." The Interstates were built with a design speed of 100 mph. It was assumed that as technology advanced cars would get faster. Then Ralph Nader and Joan Claybrook and other whiny-ass liberals got involved. Here's a clue, last year was the first full year since Congress did away with the Federal 55 mph limit and despite numerous states raising their Interstate speed limits, and in some cases doing away with them, the number of accident related deaths still went down. Speed doesn't cause accidents and never has. Moronic incompetent drivers in rattle trap shit cars cause accidents. I'd bet I'm a safer driver at 95 mph than you are at 45. And if I want you to preach to me, I'll come to your fucking church.

From: ae826@leo.nmc.edu
Message-ID: <332b0541.0@zeus.moa.net>
Source record: 203979

I have made some (very) simple modifications to the MDT program that should improve the screen and datafile output, but the Borland C compiler I ordered will not arrive at my home for about 2 weeks due to the fact I have ordered the Education version instead of buying the shelf version (same version, but half price!) It pays to work for a school district sometimes, but I usually have to wait a long time for impulse purchases! This is not a drastic re-write, I will work on it more when I get my compiler. I just wanted to make the screen more readable. All other functions will remain the same until I can delve into it more fully.

If someone can compile for me (Borland C), let me know via email. I intend to post the source code free along with the compiled program. If you can help me out, please contact me!

Thanks,

Tom

..actually the frequencies are out there, it's just knowing what to listen for and when. The equipment you describe is available from manufacturers (it also has to be type certified by the FCC) that advertise both the capabilities of the equipment and the available frequencies that their equipment operates on. So what's the big deal. Lately there has been an over abundance of the deer population. If each deer wore a transmitter and if each vehicle had a "collision" warning receiver, maybe there would be less car/deer accidents......enjoy......

Actually Bill, you again seem to be the person that has not a clue
what is going on. Read it again. Slowly.

The original poster said, complete this sentence...

You've got questions, We've got........

Then, the reply was......

No freakin idea what you're talking about.....

Now, here is the hard part Bill. Put them together....

You've got questions, We've got no freaking idea what you're talking
about.

Got it?

While all of the above is true, current FAA regulations prohibit you from using your scanner during takeoff, and landing. Basically anytime the seatbelt light is on, keep it off!

WHAT *OTHER* MODIFICATIONS were done, anyone?

My older model has a resistor jumper, wire jumper, trace cut, & an IC piggy-backed on top of another IC on the middle board. Hopefully the newer models had, say..... birdie mod, or now metal-enclosed parts, or just improved circuits?

5255. Re: Can the BC9000XLT be Modified?

Newsgroup: rec.radio.scanner

The column covered these BC9000XLT topics:

1) restoring full 800 MHz coverage by creating a "virtual downconverter"
(Requires service manual to locate parts and traces.)
2) adding a baseband audio tap for use with CTCSS/DCS readers
3) a few keypad tricks and operational techniques

Marc,

I use one of the RS cell lookalike antennas with my Pro-2026 and
overall I am quite satisfied with it. Of course, I live in a suburban area
relatively near the stations that I'm trying to monitor and listen to
VHF-Hi, aircraft, marine and UHF stations..
A friend had one and he was less happy. But then, he was trying to
listen to a VHF-Lo station about 20 miles away. The signals were received,
but were scratchy and broken. Switching to a regular whip antenna solved
his problem.
So, I guess the answer is, "it depends." It depends on where you live
and what you're trying to hear.

John

Oooh, a gun nut, I'm scared. Actually, according to witnesses, the
little old lady came flying across several lanes of traffic and cut
the other car off. The black guys had a right to be pissed, but they
overreacted a bit.

Scott Gibson

p.s. If we're going to start waving guns around, I bet mine's bigger
than yours.

5268. Descrambler.... to those that responded... thanks
